Peptidase_S8	PDOC00125	Serine proteases, subtilase family, active sites	Subtilases [1,2] are an extensive family of serine proteases whose catalytic activity is provided by a charge relay system similar to that of the trypsin family of serine proteases but which evolved by independent convergent evolution. The sequence around the residues involved in the catalytic triad (aspartic acid, serine and histidine) are completely different from that of the analogous residues in the trypsin serine proteases and can be used as signatures specific to that category of proteases. The subtilase family currently includes the following proteases: - Subtilisins (EC 3.4.21.62), these alkaline proteases from various Bacillus species have been the target of numerous studies in the past thirty years. - Alkaline elastase YaB from Bacillus sp. (gene ale). - Alkaline serine exoprotease A from Vibrio alginolyticus (gene proA). - Aqualysin I from Thermus aquaticus (gene pstI). - AspA from Aeromonas salmonicida. - Bacillopeptidase F (esterase) from Bacillus subtilis (gene bpf). - C5A peptidase from Streptococcus pyogenes (gene scpA). - Cell envelope-located proteases PI, PII, and PIII from Lactococcus lactis. - Extracellular serine protease from Serratia marcescens. - Extracellular protease from Xanthomonas campestris. - Intracellular serine protease (ISP) from various Bacillus. - Minor extracellular serine protease epr from Bacillus subtilis (gene epr). - Minor extracellular serine protease vpr from Bacillus subtilis (gene vpr). - Nisin leader peptide processing protease nisP from Lactococcus lactis. - Serotype-specific antigene 1 from Pasteurella haemolytica (gene ssa1). - Thermitase (EC 3.4.21.66) from Thermoactinomyces vulgaris. - Calcium-dependent protease from Anabaena variabilis (gene prcA). - Halolysin from halophilic bacteria sp. 172p1 (gene hly). - Alkaline extracellular protease (AEP) from Yarrowia lipolytica (gene xpr2). - Alkaline proteinase from Cephalosporium acremonium (gene alp). - Cerevisin (EC 3.4.21.48) (vacuolar protease B) from yeast (gene PRB1). - Cuticle-degrading protease (pr1) from Metarhizium anisopliae. - KEX-1 protease from Kluyveromyces lactis.

Pfam	Prosite	Full Name	Description
			- Kexin (EC 3.4.21.61) from yeast (gene KEX-2). - Oryzin (EC 3.4 21.63) (alkaline proteinase) from Aspergillus (gene alp). - Proteinase K (EC 3.4.21.64) from Tritirachium album (gene proK). - Proteinase R from Tritirachium album (gene proR). - Proteinase T from Tritirachium album (gene proT). - Subtilisin-like protease III from yeast (gene YSP3). - Thermomycolin (EC 3.4.21.65) from Malbranchea sulfurea. - Furin (EC 3.4.21.85), neuroendocrine convertases 1 to 3 (NEC-1 to -3) and PACE4 protease from mammals, other vertebrates, and invertebrates. These proteases are involved in the processing of hormone precursors at sites comprised of pairs of basic amino acid residues [3]. - Tripeptidyl-peptidase II (EC 3.4.14.10) (tripeptidyl aminopeptidase) from Human. - Prestalk-specific proteins tagB and tagC from slime mold [4]. Both proteins consist of two domains: a N-terminal subtilase catalytic domain and a C- terminal ABC transporter domain (see <PDOC00185>). Description of pattern(s) and/or profile(s) Consensus pattern [STAIV]-x-[LIVMF]-[LIVM]-D-[DSTA]-G-[LIVMFC]-x(2,3)-[DNH] [D is the active site residue] Sequences known to belong to this class detected by the pattern the majority of subtilases with a few exceptions. Other sequence(s) detected in SWISS-PROT 44. Consensus pattern H-G-[STM]-x-[VIC]-[STAGC]-[GS]-x-[LIVMA]-[STAGCLV]-[SAGM] [H is the active site residue] Sequences known to belong to this class detected by the pattern ALL, except for aspA and ssa1 which both seem to lack the histidine active site. Other sequence(s) detected in SWISS-PROT adenylate cyclase type VIII. Consensus pattern G-T-S-x-[SA]-x-P-x(2)-[STAVC]-[AG] [S is the active site residue] Sequences known to belong to this class detected by the pattern ALL, except for nisP, tagC and S.marcescens extracellular serine protease. Other sequence(s) detected in SWISS-PROT 6. Note if a protein includes at least two of the three active site signatures, the probability of it being a serine protease from the subtilase family is 100% Note these proteins belong to family S8 in the classification of peptidases [5,E1]. Peptidase_S9	PDOC00587	Prolyl oligopeptidase family serine active site	The prolyl oligopeptidase family [1,2,3] consist of a number of evolutionary related peptidases whose catalytic activity seems to be provided by a charge relay system similar to that of the trypsin family of serine proteases, but which evolved by independent convergent evolution. The known members of this family are listed below. - Prolyl endopeptidase (EC 3.4.21.26) (PE) (also called post-proline cleaving enzyme). PE is an enzyme that cleaves peptide bonds on the C-terminal side of prolyl residues. The sequence of PE has been obtained from a mammalian species (pig) and from bacteria (Flavobacterium meningosepticum and Aeromonas hydrophila); there is a high degree of sequence conservation between these sequences. - Escherichia coli protease II (EC 3.4.21.83) (oligopeptidase B) (gene prtB) which cleaves peptide bonds on the C-terminal side of lysyl and argininyl residues. - Dipeptidyl peptidase IV (EC 3.4.14.5) (DPP IV). DPP IV is an enzyme that removes N-terminal dipeptides sequentially from polypeptides having unsubstituted N-termini provided that the penultimate residue is proline. - Yeast vacuolar dipeptidyl aminopeptidase A (DPAP A) (gene: STE13) which is responsible for the proteolytic maturation of the alpha-factor precursor. - Yeast vacuolar dipeptidyl aminopeptidase B (DPAP B) (gene: DAP2). - Acylamino-acid-releasing enzyme (EC 3.4.19.1) (acyl-peptide hydrolase). This enzyme catalyzes the hydrolysis of the amino-terminal peptide bond of an N-acetylated protein to generate a N-acetylated amino acid and a protein with a free amino-terminus. A conserved serine residue has experimentally been shown (in E.coli protease II as well as in pig and bacterial PE) to be necessary for the catalytic mechanism. This serine, which is part of the catalytic triad (Ser, His, Asp), is generally located about 150 residues away from the C-terminal extremity of these enzymes (which are all proteins that contains about 700 to 800 amino acids).

PEP-utilizers	PDOC00527	PEP-utilizing enzymes signatures	A number of enzymes that catalyze the transfer of a phosphoryl group from phosphoenolpyruvate (PEP) via a phospho-histidine intermediate have been shown to be structurally related [1,2,3,4]. These enzymes are: - Pyruvate,orthophosphate dikinase (EC 2.7.9.1) (PPDK). PPDK catalyzes the reversible phosphorylation of pyruvate and phosphate by ATP to PEP and diphosphate. In plants PPDK function in the direction of the formation of PEP, which is the primary acceptor of carbon dioxide in C4 and crassulacean acid metabolism plants. In some bacteria, such as Bacteroides symbiosus, PPDK functions in the direction of ATP synthesis. - Phosphoenolpyruvate synthase (EC 2.7.9.2) (pyruvate,water dikinase). This enzyme catalyzes the reversible phosphorylation of pyruvate by ATP to form PEP, AMP and phosphate, an essential step in gluconeogenesis when pyruvate and lactate are used as a carbon source. - Phosphoenolpyruvate-protein phosphotransferase (EC 2.7.3.9). This is the first enzyme of the phosphoenolpyruvate-dependent sugar phosphotransferase

Pfam	Prosite	Full Name	Description
			system (PTS), a major carbohydrate transport system in bacteria. The PTS catalyzes the phosphorylation of incoming sugar substrates concomitant with their translocation across the cell membrane. The general mechanism of the PTS is the following: a phosphoryl group from PEP is transferred to enzyme-I (EI) of PTS which in turn transfers it to a phosphoryl carrier protein (HPr). Phospho-HPr then transfers the phosphoryl group to a sugar- specific permease. All these enzymes share the same catalytic mechanism: they bind PEP and transfer the phosphoryl group from it to a histidine residue. The sequence around that residue is highly conserved and can be used as a signature pattern for these enzymes. As a second signature pattern we selected a conserved region in the C-terminal part of the PEP-utilizing enzymes. The biological significance of this region is not yet known. Description of pattern(s) and/or profile(s) Consensus pattern G-[GA]-x-[STN]-x-H-[STA]-[STAV]-[LIVM](2)-[STAV]-[RG] [H is phosphorylated] Sequences known to belong to this class detected by the pattern ALL. phoslip	PDOC00109	Phospholipase A2 active sites signatures	Phospholipase A2 (EC 3.1.1.4) (PA2) [1,2] is an enzyme which releases fatty acids from the second carbon group of glycerol. PA2's are small and rigid proteins of 120 amino-acid residues that have four to seven disulfide bonds. PA2 binds a calcium ion which is required for activity. The side chains of two conserved residues, a histidine and an aspartic acid, participate in a 'catalytic network'. Many PA2's have been sequenced from snakes, lizards, bees and mammals. In the latter, there are at least four forms: pancreatic, membrane-associated as well as two less characterized forms. The venom of most snakes contains multiple forms of PA2. Some of them are presynaptic neurotoxins which inhibit neuromuscular transmission by blocking acetylcholine release from the nerve termini. We derived two different signature patterns for PA2's. The first is centered on the active site histidine and contains three cysteines involved in disulfide bonds. The second is centered on the active site aspartic acid and also contains three cysteines involved in disulfide bonds. Description of pattern(s) and/or profile(s) Consensus pattern C-C-x(2)-H-x(2)-C [H is the active site residue] Sequences known to belong to this class detected by the pattern ALL known functional PA2's. However, this pattern will not detect some snake toxins homologous with PA2 but which have lost their catalytic activity as well as otoconin-22, a Xenopus protein from the aragonitic otoconia which is also unlikely to be enzymatically active. Other sequence(s) detected in SWISS-PROT 15. Consensus pattern [LIVMA]-C-{LIVMFYWPCST}-C-D-x(5)-C [D is the active site residue] Sequences known to belong to this class detected by the pattern the majority of functional and non-functional PA2's. Undetected sequences are bee PA2, gila monster PA2's, PA2 PL-X from habu and PA2 PA-5 from mulga. Other sequence(s) detected in SWISS-PROT 12. PI3_PI4_kinase	PDOC00710	Phosphatidylinositol 3- and 4-kinases signatures	Phosphatidylinositol 3-kinase (PI3-kinase) (EC 2.7.1.137) [1] is an enzyme that phosphorylates phosphoinositides on the 3-hydroxyl group of the inositol ring. The exact function of the three products of PI3-kinase - PI-3-P, PI-3,4-P(2) and PI-3,4,5-P(3) - is not yet known, although it is proposed that they function as second messengers in cell signalling. Currently, three forms of PI3-kinase are known: - The mammalian enzyme which is a heterodimer of a 110 Kd catalytic chain (p110) and an 85 Kd subunit (p85) which allows it to bind to activated tyrosine protein kinases. There are at least two different types of p100 subunits (alpha and beta). - Yeast TOR1/DRR1 and TOR2/DRR2 [2], PI3-kinases required for cell cycle activation. Both are proteins of about 280 Kd. - Yeast VPS34 [3], a PI3-kinase involved in vacuolar sorting and segregation. VPS34 is a protein of about 100 Kd. - Arabidopsis thaliana and soybean VPS34 homologs. Phosphatidylinositol 4-kinase (PI4-kinase) (EC 2.7.1.67) [4] is an enzyme that acts on phosphatidylinositol (PI) in the first committed step in the production of the second messenger inositol-1,4,5,-trisphosphate. Currently the following forms of PI4-kinases are known: - Human PI4-kinase alpha. - Yeast PIK1, a nuclear protein of 120 Kd. - Yeast STT4, a protein of 214 Kd. The PI3- and PI4-kinases share a well conserved domain at their C-terminal section; this domain seems to be distantly related to the catalytic domain of protein kinases [2]. We developed two signature patterns from the best conserved parts of this domain. Four additional proteins belong to this family: - Mammalian FKBP-rapamycin associated protein (FRAP) [5], which acts as the target for the cell-cycle arrest and immunosuppressive effects of the FKBP12-rapamycin complex. - Yeast protein ESR1 [6] which is required for cell growth, DNA repair and meiotic recombination. - Yeast protein TEL1 which is involved in controlling telomere length. - Yeast hypothetical protein YHR099w, a distantly related member of this family.

P-II	PDOC00439	P-II protein signatures	The P-II protein (gene glnB) is a bacterial protein important for the control of glutamine synthetase [1,2,3]. In nitrogen-limiting conditions, when the ratio of glutamine to 2-ketoglutarate decreases, P-II is uridylylated on a tyrosine residue to form P-II-UMP. P-II-UMP allows the deadenylation of glutamine synthetase (GS), thus activating the enzyme. Conversely, in nitrogen excess, P-II-UMP is deuridylated and then promotes the adenylation of GS. P-II also indirectly controls the transcription of the GS gene (glnA) by preventing NR-II (ntrB) to phosphorylate NR-I (ntrC) which is the transcriptional activator of glnA. Once P-II is uridylylated, these events are reversed. P-II is a protein of about 110 amino acid residues extremely well conserved. The tyrosine which is urydylated is located in the central part of the protein.

09594300 - 042400

Pfam	Prosite	Full Name	Description
			In cyanobacteria, P-II seems to be phosphorylated on a serine residue rather than being urydylated. In methanogenic archaebacteria, the nitrogenase iron protein gene (nifH) is followed by two open reading frames highly similar to the eubacterial P-II protein [4]. These proteins could be involved in the regulation of nitrogen fixation. In the red alga, Porphyra purpurea, there is a glnB homolog encoded in the chloroplast genome. Other proteins highly similar to glnB are: - Bacillus subtilis protein nrgB [5]. - Escherichia coli hypothetical protein ybal [6]. We developed two signature patterns for P-II protein. The first one is a conserved stretch (in eubacteria) of six residues which contains the urydylated tyrosine, the other is derived from a conserved region in the C-terminal part of the P-II protein. Description of pattern(s) and/or profile(s) Consensus pattern Y-[KR]-G-[AS]-[AE]-Y [The second Y is uridylated] Sequences known to belong to this class detected by the pattern ALL glnB's from eubacteria. Other sequence(s) detected in SWISS-PROT 4. Consensus pattern [ST]-x(3)-G-[DY]-G-[KR]-[IV]-[FW]-[LIVM]-x(2)-[LIVM] Sequences known to belong to this class detected by the pattern ALL. pilin	PDOC00342	Prokaryotic N-terminal methylation site	A number of bacteria express filamentous adhesins known as pili. The pili are polar flexible filaments of about 5.4 nm diameter and 2500 nm average length;

09838300 - 110902

Pfam	Prosite	Full Name	Description
			they consist of a single polypeptide chain (called pilin or fimbrial protein) arranged in a helical configuration of five subunits per turn in the assembled pilus. Gram-negative bacteria produce pilin which are characterized by the presence of a very short leader peptide of 6 to 7 residues, followed by a methylated N-terminal phenylalanine residue and by a highly conserved sequence of about 24 hydrophobic residues. This class of pilin is often referred to as NMePhe or type-4 pili [1,2]. Recently a number of bacterial proteins have been sequenced which share the following structural characteristics with type-4 pili [3]: a) The N-terminal residue, which is methylated, is hydrophobic (generally a phenylalanine or a methionine); b) The leader peptide is hydrophilic, consists of 5 to 10 residues (with two exceptions, see below) and ends with a glycine; c) The fifth residue of the mature sequence is a glutamate which seems to be required for the methylation step; d) The first twenty residues of the mature sequence are highly hydrophobic. These proteins are listed below: - Four proteins in an operon involved in a general secretion pathway (GSP) for the export of proteins (also called the type II pathway) [4]. These proteins have been assigned a different gene name in each of the species where they have been sequenced: Species — Gene names Aeromonas hydrophila — exeG exeH exeI exeJ Erwinia chrysanthemi — outG outH outI outJ Escherichia coli — hofG hofH yheH yheI Klebsiella pneumoniae — pulG pulH pulI pulJ Pseudomonase aeruginosa — xcpT xcpU xcpV xcpW Vibrio cholerae — epsG epsH epsI epsJ Xanthomonas campestris — xpsG xpsH xpsI xpsJ - Vibrio cholerae toxin co-regulated pilin (gene tcpA). This pilin has a much longer putative leader peptide (25 residues). - Bacillus subtilis comG competence operon proteins 3, 4, and 5 which are involved for the uptake of DNA by competent Bacillus subtilis cells. - ppdA, ppdB and ppdC, three Escherichia coli hypothetical proteins found in the thyA-recC intergenic region. - ppdA, a hypothetical protein near the groeLS operon of Clostridium perfringens. The putative leader peptide is 23 residues long. We developed a signature pattern based on the N-terminal conserved region of all these proteins. Description of pattern(s) and/or profile(s) Consensus pattern [KRHEQSTAG]-G-[FYLIVM]-[ST]-[LT]-[LIVP]-E-[LIVMFWSTAG](14) [The residue after the G is methylated]

Pfam	Prosite	Full Name	Description
			Comment: lysophsopholipids and are capable in vitro of hydrolyzing all Comment: phospholipids extractable form yeast cells [1]. Comment: Cytosolic phospholipase A2 associates with natural membranes in Comment: response to physiological increases in Ca2+ and selectively Comment: hydrolyses arachidonyl phospholipids [2], the aligned region Comment. corresponds the the carboxy-terminal Ca2+-independent catalytic Comment: domain of the protein as discussed in [2]. Number of members: 23
PLAT		PLAT/LH2 domain	Accession number: PF01477 Definition: PLAT/LH2 domain Author: Bateman A Alignment method of seed: Manual Source of seed members: Bateman A Gathering cutoffs: 25 25 Trusted cutoffs: 29.40 29.40 Noise cutoffs. -7.90 -7.90 HMM build command line: hmmbuild HMM SEED HMM build command line: hmmcalibrate --seed 0 HMM Database Reference: SCOP; 1lpa; fa; [SCOP-USA][CATH-PDBSUM] Database reference: PROSITE_PROFILE; PS50095; Database Reference INTERPRO; IPR001024; Database Reference PDB; 1lox ; 2; 112; Database Reference PDB; 1hpl B; 336; 445; Database Reference PDB; 1hpl A; 338; 447; Database Reference PDB; 1eth C; 337; 403; Database Reference PDB; 1eth A; 339; 405; Database Reference PDB; 1eth C; 403; 445; Database Reference PDB; 1eth A; 405; 447; Database Reference PDB; 1rp1 ; 339; 449; Database Reference PDB; 1bu8 A; 340; 407; Database Reference PDB; 1bu8 A; 415; 452; Database Reference PDB; 1gpl ; 322; 334; Database Reference PDB; 1ca1 ; 256; 370; Database Reference PDB; 1qm6 A; 256; 370; Database Reference PDB; 1qm6 B; 256; 370; Database Reference PDB; 1qmd A; 256; 370; Database Reference PDB; 1qmd B; 256; 370; Comment: This domain is found in a variety of membrane or Comment: lipid associated proteins. It is called the PLAT Comment: (Polycystin-1, Lipoxygenase, Alpha-Toxin) domain or Comment: LH2 (Lipoxygenase homology) domain. The known structure Comment: of pancreatic lipase shows this domain binds to procolipase Comment. Colipase, which mediates membrane association. Comment: So it appears possible that this domain mediates membrane Comment: attachment via other protein binding partners. The Comment: structure of this domain is known for many members of the Comment: family and is composed of a beta sandwich. Number of members: 82
PLRV_ORF5		Potato leaf roll virus readthrough protein	Accession number: PF01690 Definition: Potato leaf roll virus readthrough protein Author: Bashton M, Bateman A Alignment method of seed: Clustalw Source of seed members: Pfam-B_1335 (release 4.1) Gathering cutoffs: 25 25 Trusted cutoffs: 116.40 116.40 Noise cutoffs: -285.50 -285.50

D0E9360 - JD4300

Pfam	Prosite	Full Name	Description
			HMM build command line: hmmbuild -F HMM SEED HMM build command line: hmmcalibrate --seed 0 HMM Reference Number: [1] Reference Medline: 94233771 Reference Title: Changes in the amino acid sequence of the coat protein Reference Title: readthrough domain of potato leafroll luteovirus affect the Reference Title: formation of an epitope and aphid transmission. Reference Author: Jolly CA, Mayo MA; Reference Location: Virology 1994;201:182-185. Database Reference INTERPRO; IPR002929; Comment: This family consists mainly of the potato leaf roll virus Comment: readthrough protein. This is generated via a readthrough Comment: of open reading frame 3 a coat protein allowing transcription Comment: of open reading frame 5 to give an extended coat protein Comment: with a large c-terminal addition or read through domain [1]. Comment: The readthrough protein is thought to play a role in the Comment: circulative aphid transmission of potato leaf roll virus [1]. Comment: Also in the family is open reading frame 6 from beet western Comment: yellows virus and potato leaf roll virus both luteovirus and Comment: an unknown protein from cucurbit aphid-borne yellows virus a Comment: closterovirus. Number of members: 28
PMSR		Peptide methionine sulfoxide reductase	Accession number: PF01625 Definition: Peptide methionine sulfoxide reductase Author: Bateman A Alignment method of seed: Clustalw Source of seed members: Pfam-B_1111 (release 4.1) Gathering cutoffs: -62 -62 Trusted cutoffs: -28.00 -28.00 Noise cutoffs: -96.70 -96.70 HMM build command line: hmmbuild -F HMM SEED HMM build command line: hmmcalibrate --seed 0 HMM Reference Number: [1] Reference Medline: 96353931 Reference Title: Peptide methionine sulfoxide reductase contributes to the Reference Title: maintenance of adhesins in three major pathogens. Reference Author: Wizemann TM, Moskovitz J, Pearce BJ, Cundell D, Arvidson Reference Author: CG, So M, Weissbach H, Brot N, Masure HR; Reference Location: Proc Natl Acad Sci USA 1996;93:7985-7990. Reference Number: [2] Reference Medline: 96312545 Reference Title: Cloning the expression of a mammalian gene involved in the Reference Title: reduction of methionine sulfoxide residues in proteins. Reference Author: Moskovitz J, Weissbach H, Brot N; Reference Location: Proc Natl Acad Sci U S A 1996;93:2095-2099. Database Reference INTERPRO; IPR002569; Comment: This enzyme repairs damaged proteins. Methionine sulfoxide in proteins Comment: is reduced to methionine. Number of members: 28
Pollen_allerg_2		Ribonuclease (pollen	Accession number: PF01620

D3S3S00-4S0W0D

Pfam	Prosite	Full Name	Description
		allergen)	Definition: Ribonuclease (pollen allergen) Author: Bateman A Alignment method of seed: Clustalw Source of seed members: Pfam-B_1050 (release 4.1) Gathering cutoffs: -3 -3 Trusted cutoffs: 23.10 23.10 Noise cutoffs: -29.40 -29.40 HMM build command line: hmmbuild -F HMM SEED HMM build command line: hmmcalibrate --seed 0 HMM Reference Number: [1] Reference Medline: 95246885 Reference Title: Major allergen Phl p Vb in timothy grass is a novel pollen Reference Title: RNase. Pfam	Prosite	Full Name	Description
			Database Reference PDB; 1b0p B; 43; 328; Database Reference PDB; 2pda A; 43; 328; Database Reference PDB; 2pda B; 43; 328; Database reference: PFAMB; PB014847; Comment: This family includes the N terminal region of the pyruvate ferredoxin Comment: oxidoreductase, corresponding to the first two structural domains. Comment: This region is involved in inter subunit contacts [3]. Pyruvate Comment: oxidoreductase (POR) catalyses the final step in the fermentation Comment: of carbohydrates in anaerobic microorganisms [1]. This involves the Comment: oxidative decarboxylation of pyruvate with the participation of Comment: thiamine followed by the transfer of an acetyl moiety to coenzyme Comment: A for the synthesis of acetyl-CoA [1]. The family also includes Comment: pyruvate flavodoxin oxidoreductase as encoded by the nifJ gene in Comment: cyanobacterium which is required for growth on molecular nitrogen Comment: when iron is limited [2]. Number of members: 55
PPE		PPE family	Accession number: PF00823 Definition: PPE family Author: Bateman A Alignment method of seed: Clustalw_manual Source of seed members: Pfam-B_297 (release 3.0) Gathering cutoffs: -90 -90 Trusted cutoffs: -88.20 -88.20 Noise cutoffs: -105.30 -105.30 HMM build command line: hmmbuild -F HMM SEED HMM build command line: hmmcalibrate --seed 0 HMM Reference Number: [1] Reference Medline: 98295987 Reference Title: Deciphering the biology of Mycobacterium tuberculosis from Reference Title: the complete genome sequence. Reference Author: Reference Location: Nature 1998;393:537-544. Database Reference INTERPRO; IPR000030; Database reference: PFAMB; PB040834; Comment: This family named after a PPE motif near to the amino Comment: terminus of the domain. The PPE family of proteins Comment: all contain an amino-terminal region of about 180 Comment: amino acids. The carboxyl terminus of this family Comment: are variable, and on the basis of this region fall Comment: into at least three groups. The MPTR subgroup has Comment: tandem copies of a motif NXGXGNXG. The second subgroup Comment: contains a conserved motif at about position 350. Comment: The third group are only related in the amino terminal Comment: region. Comment: The function of these proteins is uncertain but it Comment: has been suggested that they may be related to Comment: antigenic variation of Mycobacterium tuberculosis [1]. Number of members: 75
PRA-CH		Phosphoribosyl-AMP	Accession number: PF01502

09660-1-1-00

Pfam	Prosite	Full Name	Description
		cyclohydrolase	Definition: Phosphoribosyl-AMP cyclohydrolase Author: Bateman A Alignment method of seed: Clustalw Source of seed members: Pfam-B_782 (release 4.0) Gathering cutoffs: 25 25 Trusted cutoffs: 88.20 88.20 Noise cutoffs: -44.30 -44.30 HMM build command line: hmmbuild -F HMM SEED HMM build command line: hmmcalibrate --seed 0 HMM Reference Number: [1] Reference Medline: 99129952 Reference Title: N1-(5'-phosphoribosyl)adenosine-5'-monophosphate Reference Title: cyclohydrolase: purification and characterization of a Reference Title: unique metalloenzyme. Reference Author: D'Ordine RL, Klem TJ, Davisson VJ; Reference Location: Biochemistry 1999;38:1537-1546. Database Reference INTERPRO; IPR002496; Comment: This enzyme catalyses the third step in the histidine Comment: biosynthetic pathway. It requires Zn ions for activity. Number of members: 28
PRA-PH		Phosphoribosyl-ATP pyrophosphohydrolase	Accession number: PF01503 Definition: Phosphoribosyl-ATP pyrophosphohydrolase Author: Bateman A Alignment method of seed: Clustalw Source of seed members: Pfam-B_784 (release 4.0) Gathering cutoffs: 6 6 Trusted cutoffs: 12.10 12.10 Noise cutoffs: 1.00 1.00 HMM build command line: hmmbuild -F HMM SEED HMM build command line: hmmcalibrate --seed 0 HMM Reference Number: [1] Reference Medline: 79216449 Reference Title: The product of the his4 gene cluster in Saccharomyces Reference Title: cerevisiae. A trifunctional polypeptide. Reference Author: Keesey JK Jr, Bigelis R, Fink GR; Reference Location: J Biol Chem 1979 Aug 10;254:7427-7433. Reference Author: Bruni CB, Carlomagno MS, Formisano S, Paolella G; Reference Location: Mol Gen Genet 1986;203:389-396. Database Reference INTERPRO; IPR002497; Comment: This enzyme catalyses the second step in the histidine Comment: biosynthetic pathway. Number of members: 32
PseudoU_synth_1		tRNA pseudouridine synthase	Accession number: PF01416 Definition: tRNA pseudouridine synthase Previous Pfam IDs: PseudoU_synt; Author: Howe K Alignment method of seed: Clustalw Source of seed members: swissprot Gathering cutoffs: 30 30 Trusted cutoffs: 39.10 39.10 Noise cutoffs: -55.00 -55.00 HMM build command line: hmmbuild HMM SEED HMM build command line: hmmcalibrate --seed 0 HMM Reference Number: [1] Reference Medline: 98254513

D5B3960.40300

Pfam	Prosite	Full Name	Description
			Reference Title: Transfer RNA-pseudouridine synthetase Pus1 of Saccaromyces Reference Title: cerevisiae contains one atom of zinc essential for its Reference Title: native conformation and tRNA recognition. Reference Author: Arluison V, Hountondji C, Robert B, Grosjean H; Reference Location: Biochemistry 1998;37:7268-7276. Database Reference INTERPRO; IPR001406; Database reference: PFAMB; PB027500; Comment: Involved in the formation of pseudouridine at the anticodon stem Comment: and loop of transfer-RNAs Comment: Pseudouridine is an isomer of uridine (5-(beta-D-ribofuranosyl) Comment: uracil, and id the most abundant modified nucleoside found in Comment: all cellular RNAs. Comment: The TruA-like proteins also exhibit a conserved sequence with Comment: a strictly conserved aspartic acid, likely involved in catalysis Number of members: 31
PseudoU_synth_2		RNA pseudouridylate synthase	Accession number: PF00849 Definition: RNA pseudouridylate synthase Previous Pfam IDs: YABO; Author: Bateman A Alignment method of seed: Clustalw Source of seed members: Pfam-B_421 (release 3.0) Gathering cutoffs: 20 20 Trusted cutoffs: 20.90 20.90 Noise cutoffs: -44.40 -44.40 HMM build command line: hmmbuild HMM SEED HMM build command line: hmmcalibrate --seed 0 HMM Reference Number: [1] Reference Medline: 96079974 Reference Title: A dual-specificity pseudouridine synthase: an Escherichia Reference Title: coli synthase purified and cloned on the basis of its Reference Title: specificity for psi 746 in 23S RNA is also specific for psi Reference Title: 32 in tRNA(phe). Reference Author: Wrzesinski J, Nurse K, Bakin A, Lane BG, Ofengand J; Reference Location: RNA 1995;1:437-448. Database Reference: PROSITE; PDOC00869 Database Reference: PROSITE; PDOC00885 Database Reference INTERPRO; IPR000613; Database reference: PFAMB; PB041160; Database reference: PFAMB; PB041232; Comment: Members of this family are involved in modifying bases in RNA molecules. Comment: They carry out the conversion of uracil bases to pseudouridine. This family Comment: includes RluD Swiss:P33643, a pseudouridylate synthase that converts Comment: specific uracils to pseudouridine in 23S rRNA. RluA from E. coli Comment: converts bases in both rRNA and tRNA [1]. Number of members: 78
PWI		PWI domain	Accession number: PF01480 Definition: PWI domain Author: Bateman A Alignment method of seed: Clustalw_manual Source of seed members: [1] Gathering cutoffs: 25 25 Trusted cutoffs: 64.40 64.40 Noise cutoffs: -3.50 -3.50 HMM build command line: hmmbuild HMM SEED HMM build command line: hmmcalibrate --seed 0 HMM Reference Number: [1]

Pfam	Prosite	Full Name	Description
			Reference Medline: 10322432 Reference Title: The PWI motif: a new protein domain in splicing factors. Reference Author: Blencowe BJ, Ouzounis CA; Reference Location: Trends Biochem Sci 1999;24:179-180. Database Reference INTERPRO; IPR002483; Number of members: 11
R3H		R3H domain	Accession number: PF01424 Definition: R3H domain Author: Bateman A Alignment method of seed: Manual Source of seed members: Medline:99003905 Gathering cutoffs: 25 25 Trusted cutoffs: 59.30 59.30 Noise cutoffs: 5.10 5.10 HMM build command line: hmmbuild HMM SEED HMM build command line: hmmcalibrate --seed 0 HMM Reference Number: [1] Reference Medline: 99003905 Reference Title: The R3H motif: a domain that binds single-stranded nucleic Reference Title: acids. Reference Author: Grishin NV; Reference Location: Trends Biochem Sci 1998;23:329-330. Database Reference INTERPRO; IPR001374; Database reference: PFAMB; PB041444; Comment: The name of the R3H domain comes from the characteristic spacing Comment: of the most conserved arginine and histidine residues. The Comment: function of the domain is predicted to be binding ssDNA. Number of members: 28
RepB_protein		Initiator RepB protein	Accession number: PF01051 Definition: Initiator RepB protein Author: Finn RD, Bateman A Alignment method of seed: Clustalw Source of seed members: Pfam-B_313 (release 3.0) Gathering cutoffs: 14 14 Trusted cutoffs: 19.00 16.20 Noise cutoffs: 11.80 12.90 HMM build command line: hmmbuild -f HMM SEED HMM build command line: hmmcalibrate --seed 0 HMM Reference Number: [1] Reference Medline: 98284148 Reference Title: Replication and control of circular bacterial plasmids. Reference Number: [2] Reference Medline: 97324207 Reference Title: Initiation of replication of plasmid pMV158: mechanisms of Reference Title: DNA strand-transfer reactions mediated by the initiator Reference Title: RepB protein. Reference Author: Moscoso M, Eritja R, Espinosa M; Reference Location: J Mol Biol 1997;268:840-856. Database Reference INTERPRO; IPR000525; Database Reference PDB; 1rep C; 198; 240; Database reference: PFAMB; PB000509; Comment: This protein is an initiator of plasmid replication. Comment: RepB possesses nicking-closing (topoisomerase I) like activity. Comment: It is also able to perform a strand transfer reaction on ssDNA Comment: that contains its target. Number of members: 51

D5656560 - 070499

Pfam	Prosite	Full Name	Description
Rhomboid		Rhomboid family	Accession number: PF01694 Definition: Rhomboid family Author: Sohrmann M, Bateman A Alignment method of seed: Clustalw Source of seed members: Pfam-B_1399 (release 4.1) Gathering cutoffs: 25 25 Trusted cutoffs: 143.60 143.60 Noise cutoffs: -43.60 -43.60 HMM build command line: hmmbuild HMM SEED HMM build command line: hmmcalibrate --seed 0 HMM Reference Number: [1] Reference Medline: 90249726 Reference Title: rhomboid, a gene required for dorsoventral axis Reference Title: establishment and peripheral nervous system development in Reference Title: Drosophila melanogaster. Reference Author: Bier E, Jan LY, Jan YN; Reference Location: Genes Dev 1990;4:190-203. Database Reference INTERPRO; IPR002610; Database reference: PFAMB; PB041113; Comment: This family contains integral membrane proteins that are Comment: related to Drosophila rhomboid protein Swiss:P20350. Members Comment: of this family are found in bacteria and eukaryotes. These Comment: proteins contain three strongly conserved histidines in the Comment: putative transmembrane regions that may be involved in the Comment: as yet unknown function of these proteins. Number of members: 27
Ribosomal_L18ae		Ribosomal L18ae protein family	Accession number: PF01775 Definition: Ribosomal L18ae protein family Author: Bateman A Alignment method of seed: Clustalw Source of seed members: PSI-BLAST Q02543 Gathering cutoffs: 25 25 Trusted cutoffs: 136.70 136.70 Noise cutoffs: -99.80 -99.80 HMM build command line: hmmbuild HMM SEED HMM build command line: hmmcalibrate --seed 0 HMM Database Reference INTERPRO; IPR002670; Number of members: 11
Ribosomal_L21p	PDOC00899	Ribosomal protein L21 signature	Ribosomal protein L21 is one of the proteins from the large ribosomal subunit. In Escherichia coli, L21 is known to bind to the 23S rRNA in the presence of L20. It belongs to a family of ribosomal proteins which, on the basis of sequence similarities, groups: - Eubacterial L21. - Marchantia polymorpha chloroplast L21. - Cyanelle L21. - Spinach chloroplast L21 (nuclear-encoded). Eubacterial L21 is a protein of about 100 amino-acid residues, the mature form of the spinach chloroplast L21 has 200 residues. As a signature pattern, we selected a conserved region located in the C-terminal section of these proteins. Description of pattern(s) and/or profile(s) Consensus pattern [IVT]-x(3)-[KR]-x(3)-[KRQ]-K-x(6)-G-[HF]-R-[RQ]-x(2)-[ST]

09838300 - 100300

Ribosomal_L29	PDOC00501	Ribosomal protein L29 signature	Ribosomal protein L29 is one of the proteins from the large ribosomal subunit. L29 belongs to a family of ribosomal proteins which, on the basis of sequence similarities [1], groups: - Eubacterial L29. - Red algal L29. - Archaebacterial L29. - Mammalian L35 - Caenorhabditis elegans L35 (ZK652.4). - Yeast L35. L29 is a protein of 63 to 138 amino-acid residues. As a signature pattern, we selected a conserved region located in the central section of L29. Description of pattern(s) and/or profile(s) Consensus pattern [KNQS]-[PSTLN]-x(2)-[LIMFA]-[KRGSAN]-x-[LIVYSTA]-[KR]- [KRHQS]-[DESTANRL]-[LIV]-A-[KRCQVT]-[LIVMA] Sequences known to belong to this class detected by the pattern ALL. Other sequence(s) detected in SWISS-PROT 2. Last update December 1999 / Pattern and text revised. References [1] Otaka E., Hashimoto T., Mizuta K. Protein Seq. Data Anal. 5:285-300(1993).
Ribosomal_L31e	PDOC00881	Ribosomal protein L31e signature	A number of eukaryotic and archaebacterial ribosomal proteins can be grouped on the basis of sequence similarities. One of these families consists of: - Mammalian L31 [1]. - Chlamydomonas reinhardtii L31. - Yeast L34.

09595960 - 100399

Pfam	Prosite	Full Name	Description
			- Halobacterium marismortui HL30 [2]. These proteins have 87 to 128 amino-acid residues. As a signature pattern, we selected a conserved region located in the central section. Description of pattern(s) and/or profile(s) Consensus pattern V-[KR]-[LIVM]-x(3)-[LIVM]-N-x-[AKH]-x-W-x-[KR]-G Sequences known to belong to this class detected by the pattern ALL. Other sequence(s) detected in SWISS-PROT NONE. Last update July 1999 / Pattern and text revised. References [1] Tanaka T., Kuwano Y., Kuzumaki T., Ishikawa K., Ogata K. Eur. J. Biochem. 162:45-48(1987). [2] Bergmann U., Arndt E. Biochim. Biophys. Acta 1050:56-60(1990).
Ribosomal_L35Ae	PDOC00849	Ribosomal protein L35Ae signature	A number of eukaryotic and archaebacterial ribosomal proteins can be grouped on the basis of sequence similarities. One of these families consists of: - Vertebrate L35A. - Caenorhabditis elegans L35A (F10E7.7). - Yeast L37A/L37B (Rp47). - Pyrococcus woesei L35A homolog [1]. These proteins have 87 to 110 amino-acid residues. As a signature pattern, we selected a highly conserved stretch of 22 residues in the C-terminal part of these proteins. Description of pattern(s) and/or profile(s) Consensus pattern G-K-[LIVM]-x-R-x-H-G-x(2)-G-x-V-x-A-x-F-x(3)-[LI]-P Sequences known to belong to this class detected by the pattern ALL. Other sequence(s) detected in SWISS-PROT NONE. Last update November 1997 / Pattern and text revised. References [1] Ouzounis C., Kyrpides N., Sander C. Nucleic Acids Res. 23:565-570(1995).
Ribosomal_L35p	PDOC00721	Ribosomal protein L35 signature	Ribosomal protein L35 is one of the proteins from the large subunit of the ribosome. It belongs to a family of ribosomal proteins which, on the basis of sequence similarities [1], groups: - Eubacterial L35. - Plant chloroplast L35 (nuclear-encoded). - Red algal chloroplast L35. - Cyanelle L35. L35 is a basic protein of 60 to 70 amino-acid residues. As a signature pattern we selected a conserved region in the N-terminal section.

050603.5000

Pfam	Prosite	Full Name	Description
			Description of pattern(s) and/or profile(s) Consensus pattern [LIVM]-K-[TV]-x(2)-[GSA]-[SAILV]-x-K-R-[LIVMFY]-[KRLS] Sequences known to belong to this class detected by the pattern ALL. RNA_pol	PDOC00410	Bacteriophage-type RNA polymerase family active site signatures	Many forms of RNA polymerase (EC 2.7 7.6) are known. Most RNA polymerases are multimeric enzymes, but there is a family of single chain polymerases, which are evolutionary related, and which originate from bacteriophages or from mitochondria. The RNA polymerases that belong to this family are [1]: - Podoviridae bacteriophages T3, T7, and K11 polymerase. - Bacteriophage SP6 polymerase. - Vertebrate mitochondrial polymerase (gene POLRMT). - Fungal mitochondrial polymerase (gene RPO41). - Polymerases encoded on mitochondrial linear DNA plasmids in various fungi and plants: Agaricus bitorquis pEM, Claviceps purpurea pCIK1, Neurospora crassa Kalilo; Neurospora intermedia Maranhar and maize S-2). Two conserved aspartate and one lysine residue have been shown [2,3] to be part of the active site of T7 polymerase. We have used the regions around the first aspartate and around the lysine as signature patterns for this family of polymerases. Description of pattern(s) and/or profile(s) Consensus pattern P-[LIVM]-x(2)-D-[GA]-[ST]-[AC]-[SN]-[GA]-[LIVMFY]-Q [D is the active site residue] Sequences known to belong to this class detected by the pattern ALL. Other sequence(s) detected in SWISS-PROT NONE. Number of members: 105
RNB	PDOC00904	Ribonuclease II family signature	On the basis of sequence similarities, the following bacterial and eukaryotic proteins seem to form a family: - Escherichia coli and related bacteria ribonuclease II (EC 3.1.13.1) (RNase II) (gene rnb) [1]. RNase II is an exonuclease involved in mRNA decay. It degrades mRNA by hydrolyzing single-stranded polyribonucleotides processively in the 3' to 5' direction. - Bacterial ribnuclease R [2], a 3'-5'exoribonuclease that participates in an essential cell function. - Yeast protein SSD1 (or SRK1) which is implicated in the control of the cell cycle G1 phase. - Yeast protein DIS3 [3], which binds to ran (GSP1) and ehances the the nucleotide-releasing activity of RCC1 on ran. - Fission yeast protein dis3, which is implicated in mitotic control. - Neurospora crassa cyt-4, a mitochondrial protein required for RNA 5' and 3' end processing and splicing. - Yeast protein MSU1, which is involved in mitochondrial biogenesis. - Synechocystis strain PCC 6803 protein zam [4], which control resistance to the carbonic anhydrase inhibitor acetazolamide. - Caenorhabditis elegans hypothetical protein F48E8.6. The size of these proteins range from 644 residues (rnb) to 1250 (SSD1). While their sequence is highly divergent they share a conserved domain in their C- terminal section [5]. It is possible that this domain plays a role in a putative exonuclease function that would be common to all these proteins. We have developed a signature pattern based on the core of this conserved domain. Description of pattern(s) and/or profile(s) Consensus pattern [HI]-[FYE]-[GSTAM]-[LIVM]-x(4,5)-Y-[STALV]-x-[FWVAC]-[TV]- [SA]-P-[LIVMA]-[RQ]-[KR]-[FY]-x-D-x(3)-[HQ] Sequences known to belong to this class detected by the pattern ALL. SAA_proteins	PDOC00762	Serum amyloid A proteins signature	The serum amyloid A (SAA) proteins comprise a family of vertebrate proteins that associate predominantly with high density lipoproteins (HDL) [1,2]. The synthesis of certain members of the family is greatly increased (as much as a 1000 fold) in inflammation; thus making SAA a major acute phase reactant. While the major physiological function of SAA is unclear, prolonged elevation of plasma SAA levels, as in chronic inflammation, however, results in a pathological condition, called amyloidosis, which affects the liver, kidney and spleen and which is characterized by the highly insoluble accumulation of SAA in these tissues. SAA are proteins of about 110 amino acid residues. As a signature pattern, we selected the most highly conserved region, which is located in the central part of the sequence. Description of pattern(s) and/or profile(s) Consensus pattern A-R-G-N-Y-[ED]-A-x-[QKR]-R-G-x-G-G-x-W-A Sequences known to belong to this class detected by the pattern ALL. Other sequence(s) detected in SWISS-PROT NONE. Last update June 1994 / First entry. References [1] Malle E., Steinmetz A., Raynes J.G. Atherosclerosis 102:131-146(1993). SH2	PDOC50001	Src homology 2 (SH2) domain profile	The Src homology 2 (SH2) domain is a protein domain of about 100 amino-acid residues first identified as a conserved sequence region between the oncoproteins Src and Fps [1]. Similar sequences were later found in many other intracellular signal-transducing proteins [2]. SH2 domains function as regulatory modules of intracellular signalling cascades by interacting with high affinity to phosphotyrosine-containing target peptides in a sequence- specific and strictly phosphorylation-dependent manner [3,4,5,6]. The SH2 domain has a conserved 3D structure consisting of two alpha helices and six to seven beta-strands. The core of the domain is formed by a continuous beta-meander composed of two connected beta-sheets [7]. So far, SH2 domains have been identified in the following proteins: - Many vertebrate, invertebrate and retroviral cytoplasmic (non-receptor) protein tyrosine kinases. In particular in the Src, Abl, Bkt, Csk and ZAP70 families of kinases. - Mammalian phosphatidylinositol-specific phospholipase C gamma-1 and -2. Two copies of the SH2 domain are found in those proteins in between the catalytic 'X-' and 'Y-boxes' (see <PDOC50007>). - Mammalian phosphatidyl inositol 3-kinase regulatory p85

09550550 - 101300

Pfam	Prosite	Full Name	Description
			subunit. - Some vertebrate and invertebrate protein-tyrosine phosphatases. - Mammalian Ras GTPase-activating protein (GAP). - Adaptor proteins mediating binding of guanine nucleotide exchange factors to growth factor receptors: vertebrate GRB2, Caenorhabditis elegans sem-5 and Drosophila DRK. - Mammalian Vav oncoprotein, a guanine-nucleotide exchange factor of the CDC24 family. - Miscellanous proteins interacting with vertebrate receptor protein tyrosine kinases: oncoprotein Crk, mammalian cytoplasmic proteins Nck, Shc. - STAT proteins (signal transducers and activators of transcription). - Chicken tensin. - Yeast transcriptional control protein SPT6. The profile developed to detect SH2 domains is based on a structural alignment consisting of 8 gap-free blocks and 7 linker regions totaling 92 match positions. Description of pattern(s) and/or profile(s) Sequences known to belong to this class detected by the profile ALL. Other sequence(s) detected in SWISS-PROT protein tyrosine kinases JAK1 and JAK2. Sigma54_factors	PDOC00593	Sigma-54 factors family signatures and profile	Sigma factors [1] are bacterial transcription initiation factors that promote the attachment of the core RNA polymerase to specific initiation sites and are then released. They alter the specificity of promoter recognition. Most bacteria express a multiplicity of sigma factors. Two of these factors, sigma- 70 (gene rpoD), generally known as the major or primary sigma factor, and sigma-54 (gene rpoN or ntrA) direct the transcription of a wide variety of genes. The other sigma factors, known as alternative sigma factors, are required for the transcription of specific subsets of genes. With regard to sequence similarity, sigma factors can be grouped into two classes: the sigma-54 and sigma-70 families. The sigma-70 family has many different sigma factors (see the relevant entry <PDOC00592>). The sigma-54 family consists exclusively of sigma-54 factor [2,3] required for the transcription of promoters that have a characteristic -24 and -12 consensus recognition element but which are devoid of the typical -10,-35 sequences recognized by the major sigma factors. The sigma-54 factor is also characterized by its interaction with ATP-dependent positive regulatory proteins that bind to upstream activating sequences. Structurally sigma-54 factors consist of three distinct regions: - A relatively well conserved N-terminal glutamine-rich region of

09595360 - 1 - 04 - 30 - 00

Pfam	Prosite	Full Name	Description
			about 50 residues that contains a potential leucine zipper motif. - A region of variable length which is not well conserved. - A well conserved C-terminal region of about 350 residues that contains a second potential leucine zipper, a potential DNA-binding 'helix-turn-helix' motif and a perfectly conserved octapeptide whose function is not known. We developed two signature patterns for this family of sigma factors. The first starts two residues before the N-terminal extremity of the helix-turn- helix region and ends two residues before its C-terminal extremity. The second is the conserved octapeptide. A profile has also been designed that covers the whole C-terminal region. Description of pattern(s) and/or profile(s) Consensus pattern P-[LIVM]-x-[LIVM]-x(2)-[LIVM]-A-x(2)-[LIVMFT]-x(2)-[HS]-x- S-T-[LIVM]-S-R Sequences known to belong to this class detected by the pattern ALL. Other sequence(s) detected in SWISS-PROT NONE. Consensus pattern R-R-T-[IV]-[ATN]-K-Y-R Sequences known to belong to this class detected by the pattern ALL. Other sequence(s) detected in SWISS-PROT NONE. Sequences known to belong to this class detected by the profile ALL. Other sequence(s) detected in SWISS-PROT NONE. Note this documentation entry is linked to both a signature pattern and a profile. As the profile is much more sensitive than the pattern, you should use it if you have access to the necessary software tools to do so. Last update July 1999 / Patterns and text revised. SLH	PDOC00823	S-layer homology domain signature	S-layers are paracrystalline mono-layered assemblies of (glyco)proteins which coat the surface of bacteria [1]. Several S-layer proteins and some other cell wall proteins contain one or more copies of a domain of about 50-60 residues, which has been called SLH (for S-layer homology) [2]. There is strong evidence that this domain serves as an anchor to the peptidoglycan [3]. The SLH domain has been found in: - S-layer glycoprotein of Acetogenium kivui (3 copies). - S-layer 125 Kd protein of Bacillus sphaericus (3 copies). - S-layer protein of Bacillus anthracis (3 copies). - S-layer protein of Bacillus licheniformis (3 copies).

09693360 - 040399

Pfam	Prosite	Full Name	Description
			- S-layer protein (HWP) from Bacillus brevis strain HPD31 (3 copies). - Middle cell wall protein (MWP) from Bacillus brevis strain 47 (3 copies). - S-layer protein (p100) of Thermus thermophilus (1 copy). - Outer membrane protein Omp-alpha from Thermotoga maritima (1 copy). - Cellulosome anchoring protein (gene ancA), outer layer protein B (OlpB) and a further potential cell surface glycoprotein from Clostridium thermocellum (3 copies; the first copy is missing its N-terminal third which is appended to the end of the third copy; may have arisen by circular permutation). - Amylopullulanase (gene amyB) from Thermoanaerobacter thermosulfurogenes (3 copies) - Amylopullulanase (gene aapT) from Bacillus strain XAL-601 (3 copies). - Endoglucanase from Bacillus strain KSM-635 (3 copies). - Exoglucanase (gene xynX) from Clostridium thermocellum (3 copies). - Xylanase A (gene xynA) from Thermoanaerobacter saccharolyticum (2 copies; 3 copies if a frameshift is taken into account). - Protein involved in butirosin production (ButB) from Bacillus circulans (2 incomplete copies; 3 copies if three frameshifts are taken into account). - Two hypothetical proteins from Synechocystis strain PCC 6803 (1 copy each). - A hypothetical protein with sequence similarity to amylopullulanases found 3' of amylase gene from Bacillus circulans (fragment of 1 copy; 3 copies if two frameshifts are taken into account). SLH domains are found at the N- or C-termini of mature proteins. They occur in single copy followed by a predicted coiled coil domain, or in three contiguous copies. Structurally, the SLH domain is predicted to contain two alpha-helices flanking a beta strand. The SLH sequences are fairly divergent with an average identity of about 25%. It is however possible to build a sequence pattern that starts at the second position of the domain and that spans 3/4 of its length. Description of pattern(s) and/or profile(s) Consensus pattern [LVFYT]-x-[DA]-x(2,5)-[DNGSATPHY]-[FYWPDA]-x(4)-[LIV]-x(2)- [GTALV]-x(4,6)-[LIVFYC]-x(2)-G-x-[PGSTA]-x(2,3)-[MFYA]-x- [PGAV]-x(3,10)-[LIVMA]-[STKR]-[RY]-x-[EQ]-x-[STALIVM] Sequences known to belong to this class detected by the pattern ALL. Database Reference INTERPRO; IPR002625; Comment: This family includes the Smr (Small MutS Related) proteins, Comment: and the C-terminal region of the MutS2 protein. It has been Comment: suggested that this domain interacts with the MutS1 Comment: Swiss:P23909 protein in the case of Smr proteins and with Comment: the N-terminal MutS related region of MutS2 Swiss:P94545 [1]. Number of members: 14
SRF-TF	PDOC00302	MADS-box domain signature and profile	A number of transcription factors contain a conserved domain of 56 amino-acid residues, sometimes known as the MADS-box domain [E1]. They are listed below: - Serum response factor (SRF) [1], a mammalian transcription factor that binds to the Serum Response Element (SRE). This is a short sequence of dyad symmetry located 300 bp to the 5' end of the transcription initiation site of genes such as c-fos. - Mammalian myocyte-specific enhancer factors 2A to 2D (MEF2A to MEF2D). These proteins are transcription factor which binds specifically to the MEF2 element present in the regulatory regions of many muscle-specific genes. - Drosophila myocyte-specific enhancer factor 2 (MEF2). - Yeast GRM/PRTF protein (gene MCM1) [2], a transcriptional regulator of mating-type-specific genes. - Yeast arginine metabolism regulation protein I (gene ARGR1 or ARG80). - Yeast transcription factor RLM1. - Yeast transcription factor SMP1. - Arabidopsis thaliana agamous protein (AG) [3], a probable transcription factor involved in regulating genes that determines stamen and carpel development in wild-type flowers. Mutations in the AG gene result in the replacement of the stamens by petals and the carpels by a new flower. - Arabidopsis thaliana homeotic proteins Apetala1 (AP1), Apetala3 (AP3) and

09698900 - 4DOCID

Pfam	Prosite	Full Name	Description
			Pistillata (PI) which act locally to specify the identity of the floral meristem and to determine sepal and petal development [4]. - Antirrhinum majus and tobacco homeotic protein deficiens (DEFA) and globosa (GLO) [5]. Both proteins are transcription factors involved in the genetic control of flower development. Mutations in DEFA or GLO cause the transformation of petals into sepals and of stamina into carpels. - Arabidopsis thaliana putative transcription factors AGL1 to AGL6 [6]. - Antirrhinum majus morphogenetic protein DEF H33 (squamosa). In SRF, the conserved domain has been shown [1] to be involved in DNA-binding and dimerization. We have derived a pattern that spans the complete length of the domain. The profile also spans the length of the MADS-box. Description of pattern(s) and/or profile(s) Consensus pattern R-x-[RK]-x(5)-I-x-[DNGSK]-x(3)-[KR]-x(2)-T-[FY]-x-[RK](3)- x(2)-[LIVM]-x-K(2)-A-x-E-[LIVM]-[STA]-x-L-x(4)-[LIVM]-x- [LIVM](3)-x(6)-[LIVMF]-x(2)-[FY] Sequences known to belong to this class detected by the pattern ALL. Other sequence(s) detected in SWISS-PROT NONE. Sequences known to belong to this class detected by the profile ALL. Other sequence(s) detected in SWISS-PROT NONE. Note this documentation entry is linked to both signature patterns and a profile. As the profile is much more sensitive than the patterns, you should use it if you have access to the necessary software tools to do so. Last update July 1999 / Pattern and text revised. The binding of the SRP halts Comment: translation and the complex is then transported to the endoplasmic Comment: reticulum's cytoplasmic surface. The SRP then aids translocation of Comment: the protein through the ER membrane. The SRP is a ribonucleoprotein Comment: that is composed of a small RNA and several proteins. One of these Comment: proteins is the SRP19 protein [1] (Sec65 in yeast [2,3]). Number of members: 13
SSB	PDOC00602	Single-strand binding protein family signatures	The Escherichia coli single-strand binding protein [1] (gene ssb), also known as the helix-destabilizing protein, is a protein of 177 amino acids. It binds tightly, as a homotetramer, to single-stranded DNA (ss-DNA) and plays an important role in DNA replication, recombination and repair. Closely related variants of SSB are encoded in the genome of a variety of large self-transmissible plasmids. SSB has also been characterized in bacteria such as Proteus mirabilis or Serratia marcescens. Eukaryotic mitochondrial proteins that bind ss-DNA and are probably involved in mitochondrial DNA replication are structurally and evolutionary related to prokaryotic SSB. Proteins currently known to belong to this subfamily are listed below [2]. - Mammalian protein Mt-SSB (P16). - Xenopus Mt-SSBs and Mt-SSBr.

D0G3G3 : 4D4304

Pfam	Prosite	Full Name	Description
			- Drosophila MtSSB. - Yeast protein RIM1. We have developed two signature patterns for these proteins. The first is a conserved region in the N-terminal section of the SSB's. The second is a centrally located region which, in Escherichia coli SSB, is known to be involved in the binding of DNA. Sulfatase	PDOC00117	Sulfatases signatures	Sulfatases (EC 3.1.6.-) are enzymes that hydrolyze various sulfate esters. The sequence of different types of sulfatases are available. These enzymes are: - Arylsulfatase A (EC 3.1.6.8) (ASA), a lysosomal enzyme which hydrolyzes cerebroside sulfate. - Arylsulfatase B (EC 3.1.6.12) (ASB), a lysosomal enzyme which hydrolyzes the sulfate ester group from N-acetylgalactosamine 4-sulfate residues of dermatan sulfate. - Arylsulfatase C (ASD). - Arylsulfatase E (ASE). - Steryl-sulfatase (EC 3.1.6.2) (STS) (arylsulfatase C), a membrane bound microsomal enzyme which hydrolyzes 3-beta-hydroxy steroid sulfates. - Iduronate 2-sulfatase precursor (EC 3.1.6.13) (IDS), a lysosomal enzyme that hydrolyzes the 2-sulfate groups from non-reducing-terminal iduronic acid residues in dermatan sulfate and heparan sulfate. - N-acetylgalactosamine-6-sulfatase (EC 3.1.6.4), an enzyme that hydrolyzes the 6-sulfate groups of the N-acetyl-D-galactosamine 6-sulfate units of chondroitin sulfate and the D-galactose 6-sulfate units of keratan sulfate. - Choline sulfatase (EC 3.1.6.6) (gene betC), a bacterial enzyme that converts choline-O-sulfate to choline. - Glucosamine-6-sulfatase (EC 3.1.6.14) (G6S), a lysosomal enzyme that hydrolyzes the N-acetyl-D-glucosamine 6-sulfate units of heparan sulfate

09693800 - 102199

Pfam	Prosite	Full Name	Description
			and keratan sulfate. - N-sulphoglucosamine sulphohydrolase (EC 3.10.1.1) (sulphamidase), the lysosomal enzyme that catalyzes the hydrolysis of N-sulfo-d-glucosamine into glucosamine and sulfate. - Sea urchin embryo arylsulfatase (EC 3.1.6.1). - Green alga arylsulfatase (EC 3.1.6.1), an enzyme which plays an important role in the mineralization of sulfates. - Arylsulfatase (EC 3.1.6.1) from Escherichia coli (gene aslA), Klebsiella aerogenes (gene atsA) and Pseudomonas aeruginosa (gene atsA). - Escherichia coli hypothetical protein yidJ. It has been shown that all these sulfatases are structurally related [1,2,3]. As signature patterns for that family of enzymes we have selected the two best conserved regions. Both regions are located in the N-terminal section of these enzymes. The first region contains a conserved arginine which could be implicated in the catalytic mechanism; it is located four residues after a position that, in eukaryotic sulfatases, is a conserved cysteine which has been shown [4] to be modified to 2-amino-3-oxopropionic acid. In prokaryotes, this cysteine is replaced by a serine. Description of pattern(s) and/or profile(s) Consensus pattern [SAP]-[LIVMST]-[CS]-[STAC]-P-[STA]-R-x(2)-[LIVMFW](2)- [TAR]-G [R is a putative active site residue] Sequences known to belong to this class detected by the pattern ALL. Other sequence(s) detected in SWISS-PROT NONE. Consensus pattern G-[YV]-x-[ST]-x(2)-[IVAS]-G-K-x(0,1)-[FYWMK]-[HL] Sequences known to belong to this class detected by the pattern ALL. Other sequence(s) detected in SWISS-PROT NONE. Last update December 1999 / Patterns and text revised. Pfam	Prosite	Full Name	Description
TEA	PDOC00479	TEA domain signature	The TEA domain [1,E1] is a DNA-binding region of about 66 to 68 amino acids which has been found in the N-terminal section of the following nuclear regulatory proteins: - Mammalian enhancer factor TEF-1. TEF-1 can bind to two distinct sequences in the SV40 enhancer and is a transcriptional activator. - Mammalian TEF-3, TEF-4 and TEF-5 [2], putative transcriptional activators highly similar to TEF-1. - Drosophila scalloped protein (gene sd), a probable transcription factor that functions in the regulation of cell-specific gene expression during Drosophila development, particularly in the differentiation of the nervous system [3]. - Emericella nidulans regulatory protein abaA. AbaA is involved in the regulation of conidiation (asexual spore); its expression leads to the cessation of vegetative growth. - Yeast trans-acting factor TEC1. TEC1 is involved in the activation of the Ty1 retrotransposon. - Caenorhabditis elegans hypothetical protein F28B12.2. As a signature pattern, we have used positions 39 to 67 of the TEA domain. Description of pattern(s) and/or profile(s) Consensus pattern G-R-N-E-L-I-x(2)-Y-I-x(3)-[TC]-x(3)-R-T-[RK](2)-Q-[LIVM]- S-S-H-[LIVM]-Q-V Sequences known to belong to this class detected by the pattern ALL. thymidylat_synt	PDOC00086	Thymidylate synthase active site	Thymidylate synthase (EC 2.1.1.45) [1,2] catalyzes the reductive methylation of dUMP to dTMP with concomitant conversion of 5,10-methylenetetrahydrofolate to dihydrofolate. Thymidylate synthase plays an essential role in DNA synthesis and is an important target for certain chemotherapeutic drugs. Thymidylate synthase is an enzyme of about 30 to 35 Kd in most species except in protozoan and plants where it exists as a bifunctional enzyme that includes a dihydrofolate reductase domain. A cysteine residue is involved in the catalytic mechanism (it covalently binds the 5,6-dihydro-dUMP intermediate). The sequence around the active site of this enzyme is conserved from phages to vertebrates. Description of pattern(s) and/or profile(s) Consensus pattern R-x(2)-[LIVM]-x(3)-[FW]-[QN]-x(8,9)-[LV]-x-P-C-[HAVM]- x(3)-[QMT]-[FYW]-x-[LV] [C is the active site residue] Sequences known to belong to this class detected by the pattern ALL. Other sequence(s) detected in SWISS-PROT NONE.

Topoisom_bac	PDOC00333	Prokaryotic DNA topoisomerase I active site	DNA topoisomerase I (EC 5.99.1.2) [1,2,3,4,E1] is one of the two types of enzyme that catalyze the interconversion of topological DNA isomers. Type I topoisomerases act by catalyzing the transient breakage of DNA, one strand at a time, and the subsequent rejoining of the strands. When a prokaryotic type I topoisomerase breaks a DNA backbone bond, it simultaneously forms a protein- DNA link where the hydroxyl group of a tyrosine residue is joined to a 5'- phosphate on DNA, at one end of the enzyme-severed DNA strand. Prokaryotic organisms, such as Escherichia coli, have two type I topoisomerase isozymes: topoisomerase I (gene topA) and topoisomerase III (gene topB). Eukaroytes also contain homologs of prokaryotic topoisomerase III. There are a number of conserved residues in the region around the active site

Transposase_19		Transposase 19	Members of this family are capable of in vitro and/or in vivo insertion of a donor polynucleotide into a target polynucleotide. Such biological activity is useful for inserting DNA into host genome, for example, for cloning purposes to generate a desired vector in vitro.
TRANSPOSASE_IS30	PDOC00801	Transposases, IS30 family, signature	Autonomous mobile genetic elements such as transposon or insertion sequences (IS) encode an enzyme, called transposase, required for excising and inserting the mobile element. On the basis of sequence similarities, transposases can be grouped into various families. One of these families has been shown [1,2] to consist of transposases from the following elements: - Is30 from Escherichia coli. - Is1086 from Alcaligenes eutrophus. - Is1161 from Streptococcus salivarius. - Is4351 (Tn4551) from Bacteroides fragilis. These transposases are proteins of 340 to 380 amino acids. The best conserved region is located in their C-terminal section and is used as a signature pattern. Transthyretin	PDOC00617	Transthyretin signatures	Transthyretin (prealbumin) [1] is a thyroid hormone-binding protein that seems to transport thyroxine (T4) from the bloodstream to the brain. It is a protein of about 130 amino acids that assembles as a homotetramer and forms an internal channel that binds thyroxine. Transthyretin is mainly synthesized in the brain choroid plexus. In humans, variants of the protein are associated with distinct forms of amyloidosis. The sequence of transthyretin is highly conserved in vertebrates. A number of uncharacterized proteins also belong to this family: - Escherichia coli hypothetical protein yedX. - Bacillus subtilis hypothetical protein yunM.

tRNA-synt_2d	PDOC00363	Aminoacyl-transfer RNA synthetases class-II signatures	Aminoacyl-tRNA synthetases (EC 6.1.1.-) [1] are a group of enzymes which activate amino acids and transfer them to specific tRNA molecules as the first step in protein biosynthesis. In prokaryotic organisms there are at least twenty different types of aminoacyl-tRNA synthetases, one for each different amino acid. In eukaryotes there are generally two aminoacyl-tRNA synthetases for each different amino acid: one cytosolic form and a mitochondrial form. While all these enzymes have a common function, they are widely diverse in terms of subunit size and of quaternary structure.

Pfam	Prosite	Full Name	Description
			The synthetases specific for alanine, asparagine, aspartic acid, glycine, histidine, lysine, phenylalanine, proline, serine, and threonine are referred to as class-II synthetases [2 to 6] and probably have a common folding pattern in their catalytic domain for the binding of ATP and amino acid which is different to the Rossmann fold observed for the class I synthetases [7]. Class-II tRNA synthetases do not share a high degree of similarity, however at least three conserved regions are present [2,5,8]. We have derived signature patterns from two of these regions. Description of pattern(s) and/or profile(s) Consensus pattern [FYH]-R-x-[DE]-x(4,12)-[RH]-x(3)-F-x(3)-[DE] Sequences known to belong to this class detected by the pattern the majority of class-II tRNA synthetases with the exception of those specific for alanine, glycine as well as bacterial histidine. trypsin	PDOC00124	Serine proteases, trypsin family, active sites	The catalytic activity of the serine proteases from the trypsin family is provided by a charge relay system involving an aspartic acid residue hydrogen-

Pfam	Prosite	Full Name	Description
			bonded to a histidine, which itself is hydrogen-bonded to a serine. The sequences in the vicinity of the active site serine and histidine residues are well conserved in this family of proteases [1]. A partial list of proteases known to belong to the trypsin family is shown below. - Acrosin. - Blood coagulation factors VII, IX, X, XI and XII, thrombin, plasminogen, and protein C. - Cathepsin G. - Chymotrypsins. - Complement components C1r, C1s, C2, and complement factors B, D and I. - Complement-activating component of RA-reactive factor. - Cytotoxic cell proteases (granzymes A to H). - Duodenase I. - Elastases 1, 2, 3A, 3B (protease E), leukocyte (medullasin). - Enterokinase (EC 3.4.21.9) (enteropeptidase). - Hepatocyte growth factor activator. - Hepsin. - Glandular (tissue) kallikreins (including EGF-binding protein types A, B, and C, NGF-gamma chain, gamma-renin, prostate specific antigen (PSA) and tonin). - Plasma kallikrein. - Mast cell proteases (MCP) 1 (chymase) to 8. - Myeloblastin (proteinase 3) (Wegener's autoantigen). - Plasminogen activators (urokinase-type, and tissue-type). - Trypsins I, II, III, and IV. - Tryptases. - Snake venom proteases such as ancrod, batroxobin, cerastobin, flavoxobin, and protein C activator. - Collagenase from common cattle grub and collagenolytic protease from Atlantic sand fiddler crab. - Apolipoprotein(a). - Blood fluke cercarial protease. - Drosophila trypsin like proteases: alpha, easter, snake-locus. - Drosophila protease stubble (gene sb). - Major mite fecal allergen Der p III. All the above proteins belong to family S1 in the classification of peptidases [2,E1] and originate from eukaryotic species. It should be noted that bacterial proteases that belong to family S2A are similar enough in the regions of the active site residues that they can be picked up by the same patterns. These proteases are listed below. - Achromobacter lyticus protease I. - Lysobacter alpha-lytic protease. - Streptogrisin A and B (Streptomyces proteases A and B). - Streptomyces griseus glutamyl endopeptidase II. - Streptomyces fradiae proteases 1 and 2. Description of pattern(s) and/or profile(s) Consensus pattern [LIVM]-[ST]-A-[STAG]-H-C [H is the active site residue] Sequences known to belong to this class detected by the pattern ALL, except for complement components C1r and C1s, pig plasminogen, bovine protein C, rodent urokinase, ancrod, gyroxin and two insect trypsins. Other sequence(s) detected in SWISS-PROT 14.

tyrosinase	PDOC00398	Tyrosinase signatures	Tyrosinase (EC 1.14.18.1) [1] is a copper monooxygenases that catalyzes the hydroxylation of monophenols and the oxidation of o-diphenols to o-quinols. This enzyme, found in prokaryotes as well as in eukaryotes, is involved in the formation of pigments such as melanins and other polyphenolic compounds. Tyrosinase binds two copper ions (CuA and CuB). Each of the two copper ion has been shown [2] to be bound by three conserved histidines residues. The regions around these copper-binding ligands are well conserved and also shared by some hemocyanins, which are copper-containing oxygen carriers from the hemolymph of

Docket # 2750-1237P
Appln. No. 09/893,253

Pfam	Prosite	Full Name	Description
			many molluscs and arthropods [3,4]. At least two proteins related to tyrosinase are known to exist in mammals: - TRP-1 (TYRP1) [5], which is responsible for the conversion of 5,6-dihydro- xyindole-2-carboxylic acid (DHICA) to indole-5,6-quinone-2-carboxylic acid. - TRP-2 (TYRP2) [6], which is the melanogenic enzyme DOPAchrome tautomerase (EC 5.3.3.12) that catalyzes the conversion of DOPAchrome to DHICA. TRP-2 differs from tyrosinases and TRP-1 in that it binds two zinc ions instead of copper [7]. Other proteins that belong to this family are: - Plants polyphenol oxidases (PPO) (EC 1.10.3.1) which catalyze the oxidation of mono- and o-diphenols to o-diquinones [8]. - Caenorhabditis elegans hypothetical protein C02C2.1. We have derived two signature patterns for tyrosinase and related proteins. The first one contains two of the histidines that bind CuA, and is located in the N-terminal section of tyrosinase. The second pattern contains a histidine that binds CuB, that pattern is located in the central section of the enzyme. Description of pattern(s) and/or profile(s) Consensus pattern H-x(4,5)-F-[LIVMFTP]-x-[FW]-H-R-x(2)-[LVM]-x(3)-E [The two H's are copper ligands] Sequences known to belong to this class detected by the pattern ALL. ubiquitin	PDOC00271	Ubiquitin domain signature and profile	Ubiquitin [1,2,3] is a protein of seventy six amino acid residues, found in all eukaryotic cells and whose sequence is extremely well conserved from protozoan to vertebrates. It plays a key role in a variety of cellular processes, such as ATP-dependent selective degradation of cellular proteins, maintenance of chromatin structure, regulation of gene expression, stress response and ribosome biogenesis. In most species, there are many genes coding for ubiquitin. However they can be classified into two classes. The first class produces polyubiquitin molecules consisting of exact head to tail repeats of ubiquitin. The number of repeats is variable (up to twelve in a Xenopus gene). In the majority of polyubiquitin precursors, there is a final amino-acid after the last repeat. The second class of genes produces precursor proteins consisting of a single copy of ubiquitin fused to a C-terminal extension protein (CEP). There are two types of CEP proteins and both seem to be ribosomal proteins. Ubiquitin is a globular protein, the last four C-terminal residues (Leu-Arg-Gly-Gly) extending from the compact structure to form a 'tail', important for its function. The latter is mediated by the covalent conjugation of ubiquitin to target proteins, by an isopeptide linkage between the C-terminal glycine and the epsilon amino group of lysine residues in the target proteins. There are a number of proteins which are evolutionary related to ubiquitin: - Ubiquitin-like proteins from baculoviruses as well as in some strains of bovine viral diarrhea viruses (BVDV). These proteins are highly similar to their eukaryotic counterparts. - Mammalian protein GDX [4]. GDX is composed of two domains, a N-terminal ubiquitin-like domain of 74 residues and a C-terminal domain of 83 residues with some similarity with the thyroglobulin hormonogenic site. - Mammalian protein FAU [5]. FAU is a fusion protein which

DOCKET A L A R M

Pfam	Prosite	Full Name	Description
			consist of a N-terminal ubiquitin-like protein of 74 residues fused to ribosomal protein S30. - Mouse protein NEDD-8 [6], a ubiquitin-like protein of 81 residues. - Human protein BAT3, a large fusion protein of 1132 residues that contains a N-terminal ubiquitin-like domain. - Caenorhabditis elegans protein ubl-1 [7]. Ubl-1 is a fusion protein which consist of a N-terminal ubiquitin-like protein of 70 residues fused to ribosomal protein S27A. - Yeast DNA repair protein RAD23 [8]. RAD23 contains a N-terminal domain that seems to be distantly, yet significantly, related to ubiquitin. - Mammalian RAD23-related proteins RAD23A and RAD23B. - Mammalian BCL-2 binding athanogene-1 (BAG-1). BAG-1 is a protein of 274 residues that contains a central ubiquitin-like domain. - Human spliceosome associated protein 114 (SAP 114 or SF3A120). - Yeast protein DSK2, a protein involved in spindle pole body duplication and which contains a N-terminal ubiquitin-like domain. - Human protein CKAP1/TFCB, Schizosaccharomyces pombe protein alp11 and Caenorhabditis elegans hypothetical protein F53F4.3. These proteins contain a N-terminal ubiquitin domain and a C-terminal CAP-Gly domain (see <PDOC00660>). - Schizosaccharomyces pombe hypothetical protein SpAC26A3.16. This protein contains a N-terminal ubiquitin domain. - Yeast protein SMT3. - Human ubiquitin-like proteins SMT3A and SMT3B. - Human ubiquitin-like protein SMT3C (also known as PIC1; Ubl1, Sumo-1; Gmp-1 or Sentrin). This protein is involved in targeting ranGAP1 to the nuclear pore complex protein ranBP2. - SMT3-like proteins in plants and Caenorhabditis elegans. To identify ubiquitin and related proteins we have developed a pattern based on conserved positions in the central section of the sequence. A profile was also developed that spans the complete length of the ubiquitin domain. Description of pattern(s) and/or profile(s) Consensus pattern K-x(2)-[LIVM]-x-[DESAK]-x(3)-[LIVM]-[PA]-x(3)-Q-x-[LIVM]- [LIVMC]-[LIVMFY]-x-G-x(4)-[DE] Sequences known to belong to this class detected by the pattern ALL, except for the RAD23 and SMT3 subfamilies, BAG-1 and SAP 114. Other sequence(s) detected in SWISS-PROT NONE. Sequences known to belong to this class detected by the profile ALL. Other sequence(s) detected in SWISS-PROT NONE. Note this documentation entry is linked to both a signature pattern and a profile. As the profile is much more sensitive than the pattern, you should use it if you have access to the necessary software tools to do so. Last update July 1998 / Text revised.

UQ_con	PDOC00163	Ubiquitin-conjugating enzymes active site	Ubiquitin-conjugating enzymes (EC 6.3.2.19) (UBC or E2 enzymes) [1,2,3] catalyze the covalent attachment of ubiquitin to target proteins. An activated ubiquitin moiety is transferred from an ubiquitin-activating enzyme (E1) to E2 which later ligates ubiquitin directly to substrate proteins with or without the assistance of 'N-end' recognizing proteins (E3). In most species there are many forms of UBC (at least 9 in yeast) which are implicated in diverse cellular functions. A cysteine residue is required for ubiquitin-thiolester formation. There is a single conserved cysteine in UBC's and the region around that residue is conserved in the sequence of known UBC isozymes. We have used that region as a signature pattern. Description of pattern(s) and/or profile(s) Consensus pattern [FYWLSP]-H-[PC]-[NH]-[LIV]-x(3,4)-G-x-[LIV]-C-[LIV]-x- [LIV] [C is the active site residue] Sequences known to belong to this class detected by the pattern ALL, except for yeast UBC6 (DOA2). urease_gamma	PDOC00133	Urease signatures	Urease (EC 3.5.1.5) is a nickel-binding enzyme that catalyzes the hydrolysis of urea to carbon dioxide and ammonia [1]. Historically, it was the first enzyme to be crystallized (in 1926). It is mainly found in plant seeds, microorganisms and invertebrates. In plants, urease is a hexamer of identical chains. In bacteria [2], it consists of either two or three different subunits (alpha, beta and gamma). Urease binds two nickel ions per subunit; four histidine, an aspartate and a carbamated-lysine serve as ligands to these metals; an additional histidine is involved in the catalytic mechanism [3]. As signatures for this enzyme, we selected a region that contains two histidine that bind one of the nickel ions and the region of the active site histidine. Description of pattern(s) and/or profile(s) Consensus pattern T-[AY]-[GA]-[GAT]-[LIVM]-D-x-H-[LIVM]-H-x(3)-P [The two H's bind nickel] Sequences known to belong to this class detected by the pattern ALL. Other sequence(s) detected in SWISS-PROT NONE. Consensus pattern [LIVM](2)-[CT]-H-[HN]-L-x(3)-[LIVM]-x(2)-D-[LIVM]-x-F-A [H is the active site residue] Sequences known to belong to this class detected by the pattern ALL. XPG_N	PDOC00658	XPG protein signatures	Xeroderma pigmentosum (XP) [1] is a human autosomal recessive disease, characterized by a high incidence of sunlight-induced skin cancer. People's skin cells with this condition are hypersensitive to ultraviolet light, due to defects in the incision step of DNA excision repair. There are a minimum of seven genetic complementation groups involved in this pathway: XP-A to XP-G. The defect in XP-G can be corrected by a 133 Kd nuclear protein called XPG (or XPGC) [2]. XPG belongs to a family of proteins [2,3,4,5,6] that are composed of two main subsets: - Subset 1, to which belongs XPG, RAD2 from budding yeast and rad13 from fission yeast. RAD2 and XPG are single-stranded DNA endonucleases [7,8]. XPG makes the 3'incision in human DNA nucleotide excision repair [9]. - Subset 2, to which belongs mouse and human FEN-1, rad2 from fission yeast, and RAD27 from budding yeast. FEN-1 is a structure-specific endonuclease. In addition to the proteins listed in the above groups, this family also includes: - Fission yeast exo1, a 5'->3' double-stranded DNA exonuclease that could act in a pathway that corrects mismatched base pairs. - Yeast EXO1 (DHS1), a protein with probably the same function as exo1. - Yeast DIN7. Sequence alignment of this family of proteins reveals that similarities are largely confined to two regions. The first is located at the N-terminal extremity (N-region) and corresponds to the first 95 to 105 amino acids. The second region is internal (I-region) and found towards the C-terminus; it

09604-0004-00000

Pfam	Prosite	Full Name	Description
			spans about 140 residues and contains a highly conserved core of 27 amino acids that includes a conserved pentapeptide (E-A-[DE]-A-[QS]). It is possible that the conserved acidic residues are involved in the catalytic mechanism of DNA excision repair in XPG. The amino acids linking the N- and I-regions are not conserved; indeed, they are largely absent from proteins belonging to the second subset. We have developed two signature patterns for these proteins. The first corresponds to the central part of the N-region, the second to part of the I- region and includes the putative catalytic core pentapeptide. Description of pattern(s) and/or profile(s) Consensus pattern [VI]-[KRE]-P-x-[FYIL]-V-F-D-G-x(2)-[PIL]-x-[LVC]-K Sequences known to belong to this class detected by the pattern ALL. Other sequence(s) detected in SWISS-PROT NONE. Consensus pattern [GS]-[LIVM]-[PER]-[FYS]-[LIVM]-x-A-P-x-E-A-[DE]-[PAS]- [QS]-[CLM] Sequences known to belong to this class detected by the pattern ALL. 			[9] O'Donovan A., Davies A.A., Moggs J.G., West S.C , Wood R.D. Nature 371:432-435(1994).
Y_phosphatase	PDOC00323	Tyrosine specific protein phosphatases signature and profiles	Tyrosine specific protein phosphatases (EC 3.1.3.48) (PTPase) [1 to 5] are enzymes that catalyze the removal of a phosphate group attached to a tyrosine residue. These enzymes are very important in the control of cell growth, proliferation, differentiation and transformation. Multiple forms of PTPase have been characterized and can be classified into two categories: soluble PTPases and transmembrane receptor proteins that contain PTPase domain(s). The currently known PTPases are listed below: Soluble PTPases. - PTPN1 (PTP-1B). - PTPN2 (T-cell PTPase; TC-PTP). - PTPN3 (H1) and PTPN4 (MEG), enzymes that contain an N-terminal band 4.1- like domain (see <PDOC00566>) and could act at junctions between the membrane and cytoskeleton. - PTPN5 (STEP). - PTPN6 (PTP-1C; HCP; SHP) and PTPN11 (PTP-2C; SH-PTP3; Syp), enzymes which contain two copies of the SH2 domain at its N-terminal extremity. The Drosophila protein corkscrew (gene csw) also belongs to this subgroup. - PTPN7 (LC-PTP; Hematopoietic protein-tyrosine phosphatase; HePTP). - PTPN8 (70Z-PEP). - PTPN9 (MEG2). - PTPN12 (PTP-G1; PTP-P19). - Yeast PTP1. - Yeast PTP2 which may be involved in the ubiquitin-mediated protein degradation pathway. - Fission yeast pyp1 and pyp2 which play a role in inhibiting the onset of mitosis. - Fission yeast pyp3 which contributes to the dephosphorylation of cdc2. - Yeast CDC14 which may be involved in chromosome segregation. - Yersinia virulence plasmid PTPAses (gene yopH). - Autographa californica nuclear polyhedrosis virus 19 Kd PTPase. Dual specificity PTPases. - DUSP1 (PTPN10; MAP kinase phosphatase-1; MKP-1); which dephosphorylates MAP kinase on both Thr-183 and Tyr-185. - DUSP2 (PAC-1), a nuclear enzyme that dephosphorylates MAP kinases ERK1 and ERK2 on both Thr and Tyr residues. - DUSP3 (VHR). - DUSP4 (HVH2). - DUSP5 (HVH3). - DUSP6 (Pyst1; MKP-3). - DUSP7 (Pyst2; MKP-X). - Yeast MSG5, a PTPase that dephosphorylates MAP kinase FUS3. - Yeast YVH1. - Vaccinia virus H1 PTPase; a dual specificity phosphatase. Receptor PTPases.

Docket #: 2750-1237P

Pfam	Prosite	Full Name	Description
			Structurally, all known receptor PTPases, are made up of a variable length extracellular domain, followed by a transmembrane region and a C-terminal catalytic cytoplasmic domain. Some of the receptor PTPases contain fibronectin type III (FN-III) repeats, immunoglobulin-like domains, MAM domains or carbonic anhydrase-like domains in their extracellular region. The cytoplasmic region generally contains two copies of the PTPAse domain. The first seems to have enzymatic activity, while the second is inactive but seems to affect substrate specificity of the first. In these domains, the catalytic cysteine is generally conserved but some other, presumably important, residues are not. In the following table, the domain structure of known receptor PTPases is shown: Extracellular Intracellular ---------- ---------- Ig FN-3 CAH MAM PTPase Leukocyte common antigen (LCA) (CD45) 0 2 0 0 2 Leukocyte antigen related (LAR) 3 8 0 0 2 Drosophila DLAR 3 9 0 0 2 Drosophila DPTP 2 2 0 0 2 PTP-alpha (LRP) 0 0 0 0 2 PTP-beta 0 16 0 0 1 PTP-gamma 0 1 1 0 2 PTP-delta 0 >7 0 0 2 PTP-epsilon 0 0 0 0 2 PTP-kappa 1 4 0 1 2 PTP-mu 1 4 0 1 2 PTP-zeta 0 1 1 0 2 PTPase domains consist of about 300 amino acids. There are two conserved cysteines, the second one has been shown to be absolutely required for activity. Furthermore, a number of conserved residues in its immediate vicinity have also been shown to be important. We derived a signature pattern for PTPase domains centered on the active site cysteine. There are three profiles for PTPases, the first one spans the complete domain and is not specific to any subtype. The second profile is specific to dual-specificity PTPases and the third one to the PTP subfamily. Description of pattern(s) and/or profile(s) Consensus pattern [LIVMF]-H-C-x(2)-G-x(3)-[STC]-[STAGP]-x-[LIVMFY] [C is the active site residue] Sequences known to belong to this class detected by the pattern ALL, except for nine sequences. Zn_carbOpept	PDOC00123	Zinc carboxypeptidases, zinc-binding regions signatures	There are a number of different types of zinc-dependent carboxypeptidases (EC 3.4.17.-) [1,2]. All these enzymes seem to be structurally and functionally related The enzymes that belong to this family are listed below. - Carboxypeptidase A1 (EC 3.4.17.1), a pancreatic digestive enzyme that can removes all C-terminal amino acids with the exception of Arg, Lys and Pro. - Carboxypeptidase A2 (EC 3.4.17.15), a pancreatic digestive enzyme with a specificity similar to that of carboxypeptidase A1, but with a preference for bulkier C-terminal residues. - Carboxypeptidase B (EC 3.4.17.2), also a pancreatic digestive enzyme, but that preferentially removes C-terminal Arg and Lys. - Carboxypeptidase N (EC 3.4.17.3) (also known as arginine carboxypeptidase), a plasma enzyme which protects the body from potent vasoactive and inflammatory peptides containing C-terminal Arg or Lys (such as kinins or anaphylatoxins) which are released into the circulation. - Carboxypeptidase H (EC 3.4.17.10) (also known as enkephalin convertase or carboxypeptidase E), an enzyme located in secretory granules of pancreatic islets, adrenal gland, pituitary and brain. This enzyme removes residual C-terminal Arg or Lys remaining after initial endoprotease cleavage during prohormone processing. - Carboxypeptidase M (EC 3.4.17.12), a membrane bound Arg and Lys specific enzyme. It is ideally situated to act on peptide hormones at local tissue sites where it could control their activity before or after interaction with specific plasma membrane receptors. - Mast cell carboxypeptidase (EC 3.4.17.1), an enzyme with a specificity to carboxypeptidase A, but found in the secretory granules of mast cells. - Streptomyces griseus carboxypeptidase (Cpase SG) (EC 3.4.17.-) [3], which combines the specificities of mammalian carboxypeptidases A and B. - Thermoactinomyces vulgaris carboxypeptidase T (EC 3.4.17.18) (CPT) [4], which also combines the specificities of carboxypeptidases A and B. - AEBP1 [5], a transcriptional repressor active in preadipocytes. AEBP1 seems to regulate transcription by cleavage of other transcriptional proteins. - Yeast hypothetical protein YHR132c. All of these enzymes bind an atom of zinc. Three conserved residues are implicated in the binding of the zinc atom: two histidines and a glutamic acid We have derived two signature patterns which contain these three zinc-ligands.

AA. Activities of Polypeptides Comprising Signal Peptides

Polypeptides comprising signal peptides are a family of proteins that are typically targeted to (1) a particular organelle or intracellular compartment, (2) interact with a particular molecule or (3) for secretion outside of a host cell. Example of polypeptides comprising signal peptides include, without limitation, secreted proteins, soluble proteins, receptors, proteins retained in the ER, etc.

These proteins comprising signal peptides are useful to modulate ligand-receptor interactions, cell-to-cell communication, signal transduction, intracellular communication, and activities and/or chemical cascades that take part in an organism outside or within of any particular cell.

One class of such proteins are soluble proteins which are transported out of the cell. These proteins can act as ligands that bind to receptor to trigger signal transduction or to permit communication between cells.

Another class is receptor proteins which also comprise a retention domain that lodges the receptor protein in the membrane when the cell transports the receptor to the surface of the cell. Like the soluble ligands, receptors can also modulate signal transduction and communication between cells.

In addition the signal peptide itself can serve as a ligand for some receptors. An example is the interaction of the ER targeting signal peptide with the signal recognition particle (SRP). Here, the SRP binds to the signal peptide, halting translation, and the resulting SRP complex then binds to docking proteins located on the surface of the ER, prompting transfer of the protein into the ER.

A description of signal peptide residue composition is described below in Subsection IV.C.1.

III. Methods of Modulating Polypeptide Production

It is contemplated that polynucleotides of the invention can be incorporated into a host cell or in-vitro system to modulate polypeptide production. For instance, the SDFs prepared as described herein can be used to prepare expression cassettes useful in a number of techniques for suppressing or enhancing expression.

An example are polynucleotides comprising sequences to be transcribed, such as coding sequences, of the present invention can be inserted into nucleic acid constructs to modulate polypeptide production. Typically, such sequences to be transcribed are heterologous to at least one element of the nucleic acid construct to generate a chimeric gene or construct.

Another example of useful polynucleotides are nucleic acid molecules comprising regulatory sequences of the present invention. Chimeric genes or constructs can be generated when the regulatory sequences of the invention linked to heterologous sequences in a vector construct. Within the scope of invention are such chimeric gene and/or constructs.

Also within the scope of the invention are nucleic acid molecules, whereof at least a part or fragment of these DNA molecules are presented in Tables 1 and 2 of the present application, and wherein the coding sequence is under the control of its own promoter and/or its own regulatory elements. Such molecules are useful for transforming the genome of a host cell or an organism regenerated from said host cell for modulating polypeptide production.

Additionally, a vector capable of producing the oligonucleotide can be inserted into the host cell to deliver the oligonucleotide.

More detailed description of components to be included in vector constructs are described both above and below.

Whether the chimeric vectors or native nucleic acids are utilized, such polynucleotides can be incorporated into a host cell to modulate polypeptide production. Native genes and/or nucleic acid molecules can be effective when exogenous to the host cell.

Methods of modulating polypeptide expression includes, without limitation:

Suppression methods, such as

Antisense

Ribozymes

Co-suppression

Insertion of Sequences into the Gene to be Modulated

Regulatory Sequence Modulation.

as well as Methods for Enhancing Production, such as

Insertion of Exogenous Sequences; and

Regulatory Sequence Modulation.

III.A. Suppression

Expression cassettes of the invention can be used to suppress expression of endogenous genes which comprise the SDF sequence. Inhibiting expression can be useful, for instance, to tailor the ripening characteristics of a fruit (Oeller et al., *Science* 254:437 (1991)) or to influence seed size (WO98/07842) or to provoke cell ablation (Mariani et al., Nature 357: 384-387 (1992).

As described above, a number of methods can be used to inhibit gene expression in plants, such as antisense, ribozyme, introduction of exogenous genes into a host cell, insertion of a polynucleotide sequence into the coding sequence and/or the promoter of the endogenous gene of interest, and the like.

05050300-110300

III.A.1. Antisense

An expression cassette as described above can be transformed into host cell or plant to produce an antisense strand of RNA. For plant cells, antisense RNA inhibits gene expression by preventing the accumulation of mRNA which encodes the enzyme of interest, *see*, e.g., Sheehy et al., *Proc. Nat. Acad. Sci.* USA, 85:8805 (1988), and Hiatt et al., U.S. Patent No. 4,801,340.

III.A.2. Ribozymes

Similarly, ribozyme constructs can be transformed into a plant to cleave mRNA and down-regulate translation.

III.A.3. Co-Suppression

Another method of suppression is by introducing an exogenous copy of the gene to be suppressed. Introduction of expression cassettes in which a nucleic acid is configured in the sense orientation with respect to the promoter has been shown to prevent the accumulation of mRNA. A detailed description of this method is described above.

III.A.4. Insertion of Sequences into the Gene to be Modulated

Yet another means of suppressing gene expression is to insert a polynucleotide into the gene of interest to disrupt transcription or translation of the gene.

Homologous recombination could be used to target a polynucleotide insert to a gene using the Cre-Lox system (A.C. Vergunst et al., *Nucleic Acids Res.* 26:2729 (1998), A.C. Vergunst et al., *Plant Mol. Biol.* 38:393 (1998), H. Albert et al., *Plant J.* 7:649 (1995)).

In addition, random insertion of polynucleotides into a host cell genome can also be used to disrupt the gene of interest. Azpiroz-Leehan et al., *Trends in Genetics* 13:152 (1997). In this method, screening for clones from a library containing random insertions is preferred for identifying those that have polynucleotides inserted into the gene of interest. Such screening can be performed using probes and/or primers described above based on sequences from Tables 1 and 2, fragments thereof, and substantially similar sequence thereto. The screening can also be performed by selecting clones or any transgenic plants having a desired phenotype.

05050900.1050

III.A.5. Regulatory SequenceModulation

The SDFs described in Tables 1 and 2, and fragments thereof are examples of nucleotides of the invention that contain regulatory sequences that can be used to suppress or inactivate transcription and/or translation from a gene of interest as discussed in I.C.5.

III.A.6. Genes Comprising Dominant-Negative Mutations

When suppression of production of the endogenous, native protein is desired it is often helpful to express a gene comprising a dominant negative mutation. Production of protein variants produced from genes comprising dominant negative mutations is a useful tool for research Genes comprising dominant negative mutations can produce a variant polypeptide which is capable of competing with the native polypeptide, but which does not produce the native result. Consequently, over expression of genes comprising these mutations can titrate out an undesired activity of the native protein. For example, The product from a gene comprising a dominant negative mutation of a receptor can be used to constitutively activate or suppress a signal transduction cascade, allowing examination of the phenotype and thus the trait(s) controlled by that receptor and pathway. Alternatively, the protein arising from the gene comprising a dominant-negative mutation can be an inactive enzyme still capable of binding to the same substrate as the native protein and therefore competes with such native protein.

Products from genes comprising dominant-negative mutations can also act upon the native protein itself to prevent activity. For example, the native protein may be active only as a homo-multimer or as one subunit of a hetero-multimer. Incorporation of an inactive subunit into the multimer with native subunit(s) can inhibit activity.

Thus, gene function can be modulated in host cells of interest by insertion into these cells vector constructs comprising a gene comprising a dominant-negative mutation.

III.B. Enhanced Expression

Enhanced expression of a gene of interest in a host cell can be accomplished by either (1) insertion of an exogenous gene; or (2) promoter modulation.

III.B.1. Insertion of an Exogenous Gene

Insertion of an expression construct encoding an exogenous gene can boost the number of gene copies expressed in a host cell.

Such expression constructs can comprise genes that either encode the native protein that is of interest or that encode a variant that exhibits enhanced activity as compared to the native protein. Such genes encoding proteins of interest can be constructed from the sequences from Tables 1 and 2, fragments thereof, and substantially similar sequence thereto.

Such an exogenous gene can include either a constitutive promoter permitting expression in any cell in a host organism or a promoter that directs transcription only in particular cells or times during a host cell life cycle or in response to environmental stimuli.

III.B.2. Regulatory Sequence Modulation

The SDFs of Tables 1 and 2, and fragments thereof, contain regulatory sequences that can be used to enhance expression of a gene of interest. For example, some of these sequences contain useful enhancer elements. In some cases, duplication of enhancer elements or insertion of exogenous enhancer elements will increase expression of a desired gene from a particular promoter. As other examples, all ll promoters require binding of a regulatory protein to be activated, while some promoters may need a protein that signals a promoter binding protein to expose a polymerase binding site. In either case, over-production of such proteins can be used to enhance expression of a gene of interest by increasing the activation time of the promoter.

Such regulatory proteins are encoded by some of the sequences in Tables 1 and 2, fragments thereof, and substantially similar sequences thereto.

DOCKET NO. 2750-1237P

Coding sequences for these proteins can be constructed as described above.

IV. Gene Constructs and Vector Construction

To use isolated SDFs of the present invention or a combination of them or parts and/or mutants and/or fusions of said SDFs in the above techniques, recombinant DNA vectors which comprise said SDFs and are suitable for transformation of cells, such as plant cells, are usually prepared. The SDF construct can be made using standard recombinant DNA techniques (Sambrook et al. 1989) and can be introduced to the species of interest by *Agrobacterium*-mediated transformation or by other means of transformation (*e.g.*, particle gun bombardment) as referenced below.

The vector backbone can be any of those typical in the art such as plasmids, viruses, artificial chromosomes, BACs, YACs and PACs and vectors of the sort described by

(a) **BAC:** Shizuya et al., Proc. Natl. Acad. Sci. USA 89: 8794-8797 (1992); Hamilton et al., Proc. Natl. Acad. Sci. USA 93: 9975-9979 (1996);

(b) **YAC:** Burke et al., Science 236:806-812 (1987);.

(c) **PAC:** Sternberg N. et al., Proc Natl Acad Sci U S A. Jan;87(1):103-7 (1990);

(d) **Bacteria-Yeast Shuttle Vectors:** Bradshaw et al., Nucl Acids Res 23: 4850-4856 (1995);

(e) **Lambda Phage Vectors**: Replacement Vector, e.g., Frischauf et al., J. Mol Biol 170: 827-842 (1983); or Insertion vector, e.g., Huynh et al., In: Glover NM (ed) DNA Cloning: A practical Approach, Vol.1 Oxford: IRL Press (1985);

(f) **T-DNA gene fusion vectors :**Walden et al., Mol Cell Biol 1: 175-194 (1990); and

(g) **Plasmid vectors:** Sambrook et al., infra.

Typically, a vector will comprise the exogenous gene, which in its turn comprises an SDF of the present invention to be introduced into the genome of a host cell, and which gene may be an antisense construct, a ribozyme construct chimeraplast, or a coding sequence with any desired transcriptional and/or translational regulatory sequences, such as promoters, UTRs, and 3' end termination sequences. Vectors of the invention can also include origins of replication, scaffold attachment regions (SARs), markers, homologous sequences, introns, etc.

A DNA sequence coding for the desired polypeptide, for example a cDNA sequence encoding a full length protein, will preferably be combined with transcriptional and translational

initiation regulatory sequences which will direct the transcription of the sequence from the gene in the intended tissues of the transformed plant.

For example, for over-expression, a plant promoter fragment may be employed that will direct transcription of the gene in all tissues of a regenerated plant. Alternatively, the plant promoter may direct transcription of an SDF of the invention in a specific tissue (tissue-specific promoters) or may be otherwise under more precise environmental control (inducible promoters).

If proper polypeptide productionis desired, a polyadenylation region at the 3'-end of the coding region is typically included. The polyadenylation region can be derived from the natural gene, from a variety of other plant genes, or from T-DNA.

The vector comprising the sequences from genes or SDF or the invention may comprise a marker gene that confers a selectable phenotype on plant cells. The vector can include promoter and coding sequence, for instance. For example, the marker may encode biocide resistance, particularly antibiotic resistance, such as resistance to kanamycin, G418, bleomycin, hygromycin, or herbicide resistance, such as resistance to chlorosulfuron or phosphinotricin.

09609900-110300

IV.A. Coding Sequences

Generally, the sequence in the transformation vector and to be introduced into the genome of the host cell does not need to be absolutely identical to an SDF of the present invention. Also, it is not necessary for it to be full length, relative to either the primary transcription product or fully processed mRNA. Furthermore, the introduced sequence need not have the same intron or exon pattern as a native gene. Also, heterologous non-coding segments can be incorporated into the coding sequence without changing the desired amino acid sequence of the polypeptide to be produced.

IV.B. Promoters

As explained above, introducing an exogenous SDF from the same species or an orthologous SDF from another species can modulate the expression of a native gene corresponding to that SDF of interest. Such an SDF construct can be under the control of either a constitutive promoter or a highly regulated inducible promoter (*e.g.*, a copper inducible promoter). The promoter of interest can initially be either endogenous or heterologous to the species in question. When re-introduced into the genome of said species, such promoter becomes exogenous to said species. Over-expression of an SDF transgene can

lead to co-suppression of the homologous endogeneous sequence thereby creating some alterations in the phenotypes of the transformed species as demonstrated by similar analysis of the chalcone synthase gene (Napoli et al., *Plant Cell* 2:279 (1990) and van der Krol et al., *Plant Cell* 2:291 (1990)). If an SDF is found to encode a protein with desirable characteristics, its over-production can be controlled so that its accumulation can be manipulated in an organ- or tissue-specific manner utilizing a promoter having such specificity.

Likewise, if the promoter of an SDF (or an SDF that includes a promoter) is found to be tissue-specific or developmentally regulated, such a promoter can be utilized to drive or facilitate the transcription of a specific gene of interest (*e.g.*, seed storage protein or root-specific protein). Thus, the level of accumulation of a particular protein can be manipulated or its spatial localization in an organ- or tissue- specific manner can be altered.

09560360.1400

IV. C Signal Peptides

SDFs of the present invention containing signal peptides are indicated in Tables 1 and 2. In some cases it may be desirable for the protein encoded by an introduced exogenous or orthologous SDF to be targeted (1) to a particular organelle intracellular compartment, (2) to interact with a particular molecule such as a membrane molecule or (3) for secretion outside of the cell harboring the introduced SDF. This will be accomplished using a signal peptide.

Signal peptides direct protein targeting, are involved in ligand-receptor interactions and act in cell to cell communication. Many proteins, especially soluble proteins, contain a signal peptide that targets the protein to one of several different intracellular compartments. In plants, these compartments include, but are not limited to, the endoplasmic reticulum (ER), mitochondria, plastids (such as chloroplasts), the vacuole, the Golgi apparatus, protein storage vessicles (PSV) and, in general, membranes. Some signal peptide sequences are conserved, such as the Asn-Pro-Ile-Arg amino acid motif found in the N-terminal propeptide signal that targets proteins to the vacuole (Marty (1999) *The Plant Cell* 11: 587-599). Other signal peptides do not have a consensus sequence *per se*, but are largely composed of hydrophobic amino acids, such as those signal peptides targeting proteins to the ER (Vitale and Denecke (1999) *The Plant Cell* 11: 615-628). Still others do not appear to contain either a consensus sequence or an identified common secondary sequence, for instance the chloroplast stromal targeting signal peptides (Keegstra and Cline (1999) *The Plant Cell* 11: 557-570). Furthermore, some targeting peptides are bipartite, directing proteins first to an organelle and then to a membrane within the organelle (e.g. within the thylakoid lumen of the

chloroplast; see Keegstra and Cline (1999) *The Plant Cell* 11: 557-570). In addition to the diversity in sequence and secondary structure, placement of the signal peptide is also varied. Proteins destined for the vacuole, for example, have targeting signal peptides found at the N-terminus, at the C-terminus and at a surface location in mature, folded proteins. Signal peptides also serve as ligands for some receptors.

These characteristics of signal proteins can be used to more tightly control the phenotypic expression of introduced SDFs. In particular, associating the appropriate signal sequence with a specific SDF can allow sequestering of the protein in specific organelles (plastids, as an example), secretion outside of the cell, targeting interaction with particular receptors, etc. Hence, the inclusion of signal proteins in constructs involving the SDFs of the invention increases the range of manipulation of SDF phenotypic expression. The nucleotide sequence of the signal peptide can be isolated from characterized genes using common molecular biological techniques or can be synthesized in vitro.

In addition, the native signal peptide sequences, both amino acid and nucleotide, described in Tables 1 and 2 can be used to modulate polypeptide transport. Further variants of the native signal peptides described in Tables 1 and 2 are contemplated. Insertions, deletions, or substitutions can be made. Such variants will retain at least one of the functions of the native signal peptide as well as exhibiting some degree of sequence identity to the native sequence.

Also, fragments of the signal peptides of the invention are useful and can be fused with other signal peptides of interest to modulate transport of a polypeptide.

DOCKET NO. 2750-1237P

V. Transformation Techniques

A wide range of techniques for inserting exogenous polynucleotides are known for a number of host cells, including, without limitation, bacterial, yeast, mammalian, insect and plant cells.

Techniques for transforming a wide variety of higher plant species are well known and described in the technical and scientific literature. *See, e.g.* Weising et al., *Ann. Rev. Genet.* 22:421 (1988); and Christou, Euphytica, v. 85, n.1-3:13-27, (1995).

DNA constructs of the invention may be introduced into the genome of the desired plant host by a variety of conventional techniques. For example, the DNA construct may be introduced directly into the genomic DNA of the plant cell using techniques such as electroporation and microinjection of plant cell protoplasts, or the DNA constructs can be introduced directly to plant tissue using ballistic methods, such as DNA particle bombardment. Alternatively, the DNA constructs may be combined with suitable T-DNA flanking regions and

introduced into a conventional *Agrobacterium tumefaciens* host vector. The virulence functions of the *Agrobacterium tumefaciens* host will direct the insertion of the construct and adjacent marker into the plant cell DNA when the cell is infected by the bacteria (McCormac et al., *Mol. Biotechnol.* 8:199 (1997); Hamilton, *Gene* 200:107 (1997)); Salomon et al. *EMBO J.* 3:141 (1984); Herrera-Estrella et al. *EMBO J.* 2:987 (1983).

Microinjection techniques are known in the art and well described in the scientific and patent literature. The introduction of DNA constructs using polyethylene glycol precipitation is described in Paszkowski et al. *EMBO J.* 3:2717 (1984). Electroporation techniques are described in Fromm et al. *Proc. Natl Acad. Sci. USA* 82:5824 (1985). Ballistic transformation techniques are described in Klein et al. *Nature* 327:773 (1987). *Agrobacterium tumefaciens*-mediated transformation techniques, including disarming and use of binary or co-integrate vectors, are well described in the scientific literature. See, for example Hamilton, *CM., Gene* 200:107 (1997); Müller et al. *Mol. Gen. Genet.* 207:171 (1987); Komari et al. *Plant J.* 10:165 (1996); Venkateswarlu et al. *Biotechnology* 9:1103 (1991) and Gleave, *AP., Plant Mol. Biol.* 20:1203 (1992); Graves and Goldman, *Plant Mol. Biol.* 7:34 (1986) and Gould et al., *Plant Physiology* 95:426 (1991).

Transformed plant cells which are derived by any of the above transformation techniques can be cultured to regenerate a whole plant that possesses the transformed genotype and thus the desired phenotype such as seedlessness. Such regeneration techniques rely on manipulation of certain phytohormones in a tissue culture growth medium, typically relying on a biocide and/or herbicide marker which has been introduced together with the desired nucleotide sequences. Plant regeneration from cultured protoplasts is described in Evans et al., *Protoplasts Isolation and Culture* in Handbook of Plant Cell Culture," pp. 124-176, MacMillan Publishing Company, New York, 1983; and Binding, *Regeneration of Plants, Plant Protoplasts,* pp. 21-73, CRC Press, Boca Raton, 1988. Regeneration can also be obtained from plant callus, explants, organs, or parts thereof. Such regeneration techniques are described generally in Klee et al. *Ann. Rev. of Plant Phys.* 38:467 (1987). Regeneration of monocots (rice) is described by Hosoyama et al. (*Biosci. Biotechnol. Biochem.* 58:1500 (1994)) and by Ghosh et al. (*J. Biotechnol.* 32:1 (1994)). The nucleic acids of the invention can be used to confer desired traits on essentially any plant.

Thus, the invention has use over a broad range of plants, including species from the genera *Anacardium, Arachis, Asparagus, Atropa, Avena, Brassica, Citrus, Citrullus, Capsicum, Carthamus, Cocos, Coffea, Cucumis, Cucurbita, Daucus, Elaeis, Fragaria, Glycine, Gossypium, Helianthus, Heterocallis, Hordeum, Hyoscyamus, Lactuca, Linum, Lolium,Lupinus,*

Lycopersicon, Malus, Manihot, Majorana, Medicago, Nicotiana, Olea, Oryza, Panieum, Pannesetum, Persea, Phaseolus, Pistachia, Pisum, Pyrus, Prunus, Raphanus, Ricinus, Secale, Senecio, Sinapis, Solanum, Sorghum, Theobromus, Trigonella, Triticum, Vicia, Vitis, Vigna, and, Zea.

One of skill will recognize that after the expression cassette is stably incorporated in transgenic plants and confirmed to be operable, it can be introduced into other plants by sexual crossing. Any of a number of standard breeding techniques can be used, depending upon the species to be crossed.

The particular sequences of SDFs identified are provided in the attached Tables 1 and 2. One of ordinary skill in the art, having this data, can obtain cloned DNA fragments, synthetic DNA fragments or polypeptides constituting desired sequences by recombinant methodology known in the art or described herein.

09650900-110600

EXAMPLES

The invention is illustrated by way of the following examples. The invention is not limited by these examples as the scope of the invention is defined solely by the claims following.

EXAMPLE 1: cDNA PREPARATION

A number of the nucleotide sequences disclosed in Tables 1 and 2 herein as representative of the SDFs of the invention can be obtained by sequencing genomic DNA (gDNA) and/or cDNA from corn plants grown from HYBRID SEED # 35A19, purchased from Pioneer Hi-Bred International, Inc., Supply Management, P.O. Box 256, Johnston, Iowa 50131-0256.

A number of the nucleotide sequences disclosed in Tables 1 and 2 herein as representative of the SDFs of the invention can also be obtained by sequencing genomic DNA from *Arabidopsis thaliana*, Wassilewskija ecotype or by sequencing cDNA obtained from mRNA from such plants as described below. This is a true breeding strain. Seeds of the plant are available from the Arabidopsis Biological Resource Center at the Ohio State University, under the accession number CS2360. Seeds of this plant were deposited under the terms and conditions of the Budapest Treaty at the American Type Culture Collection, Manassas, VA on August 31, 1999, and were assigned ATCC No. PTA-595.

Other methods for cloning full-length cDNA are described, for example, by Seki et al., *Plant Journal* 15:707-720 (1998) High-efficiency cloning of Arabidopsis full-length

cDNA by biotinylated Cap trapper"; Maruyama et al., *Gene* 138:171 (1994) Oligo-capping a simple method to replace the cap structure of eukaryotic mRNAs with oligoribonucleotides"; and WO 96/34981.

Tissues were, or each organ was, individually pulverized and frozen in liquid nitrogen. Next, the samples were homogenized in the presence of detergents and then centrifuged. The debris and nuclei were removed from the sample and more detergents were added to the sample. The sample was centrifuged and the debris was removed. Then the sample was applied to a 2M sucrose cushion to isolate polysomes. The RNA was isolated by treatment with detergents and proteinase K followed by ethanol precipitation and centrifugation. The polysomal RNA from the different tissues was pooled according to the following mass ratios: 15/15/1 for male inflorescences, female inflorescences and root, respectively. The pooled material was then used for cDNA synthesis by the methods described below.

Starting material for cDNA synthesis for the exemplary corn cDNA clones with sequences presented in Tables 1 and 2 was poly(A)-containing polysomal mRNAs from inflorescences and root tissues of corn plants grown from HYBRID SEED # 35A19. Male inflorescences and female (pre-and post-fertilization) inflorescences were isolated at various stages of development. Selection for poly(A) containing polysomal RNA was done using oligo d(T) cellulose columns, as described by Cox and Goldberg, Plant Molecular Biology: A Practical Approach", pp. 1-35, Shaw ed., c. 1988 by IRL, Oxford. The quality and the integrity of the polyA+ RNAs were evaluated.

Starting material for cDNA synthesis for the exemplary *Arabidopsis* cDNA clones with sequences presented in Tables 1 and 2 was polysomal RNA isolated from the top-most inflorescence tissues of *Arabidopsis thaliana* Wassilewskija (Ws.) and from roots of *Arabidopsis thaliana* Landsberg erecta (L. er.), also obtained from the Arabidopsis Biological Resource Center. Nine parts inflorescence to every part root was used, as measured by wet mass. Tissue was pulverized and exposed to liquid nitrogen. Next, the sample was homogenized in the presence of detergents and then centrifuged. The debris and nuclei were removed from the sample and more detergents were added to the sample. The sample was centrifuged and the debris was removed and the sample was applied to a 2M sucrose cushion to isolate polysomal RNA. Cox et al., Plant Molecular Biology: A Practical Approach", pp. 1-35, Shaw ed., c. 1988 by IRL, Oxford. The polysomal RNA was used

for cDNA synthesis by the methods described below. Polysomal mRNA was then isolated as described above for corn cDNA. The quality of the RNA was assessed electrophoretically.

Following preparation of the mRNAs from various tissues as described above, selection of mRNA with intact 5' ends and specific attachment of an oligonucleotide tag to the 5' end of such mRNA was performed using either a chemical or enzymatic approach. Both techniques take advantage of the presence of the cap" structure, which characterizes the 5' end of most intact mRNAs and which comprises a guanosine generally methylated once, at the 7 position.

The chemical modification approach involves the optional elimination of the 2', 3'-cis diol of the 3' terminal ribose, the oxidation of the 2', 3'-cis diol of the ribose linked to the cap of the 5' ends of the mRNAs into a dialdehyde, and the coupling of the such obtained dialdehyde to a derivatized oligonucleotide tag. Further detail regarding the chemical approaches for obtaining mRNAs having intact 5' ends are disclosed in International Application No. WO96/34981 published November 7, 1996.

The enzymatic approach for ligating the oligonucleotide tag to the intact 5' ends of mRNAs involves the removal of the phosphate groups present on the 5' ends of uncapped incomplete mRNAs, the subsequent decapping of mRNAs having intact 5' ends and the ligation of the phosphate present at the 5' end of the decapped mRNA to an oligonucleotide tag. Further detail regarding the enzymatic approaches for obtaining mRNAs having intact 5' ends are disclosed in Dumas Milne Edwards J.B. (Doctoral Thesis of Paris VI University, Le clonage des ADNc complets: difficultés et perspectives nouvelles. Apports pour l'étude de la régulation de l'expression de la tryptophane hydroxylase de rat, 20 Dec. 1993), EP0 625572 and Kato *et al.*, *Gene* 150:243-250 (1994).

In both the chemical and the enzymatic approach, the oligonucleotide tag has a restriction enzyme site (e.g. an EcoRI site) therein to facilitate later cloning procedures. Following attachment of the oligonucleotide tag to the mRNA, the integrity of the mRNA is examined by performing a Northern blot using a probe complementary to the oligonucleotide tag.

D5669360.1 DOCKET

For the mRNAs joined to oligonucleotide tags using either the chemical or the enzymatic method, first strand cDNA synthesis is performed using an oligo-dT primer with reverse transcriptase. This oligo-dT primer can contain an internal tag of at least 4 nucleotides, which can be different from one mRNA preparation to another. Methylated dCTP is used for cDNA first strand synthesis to protect the internal EcoRI sites from digestion during subsequent steps. The first strand cDNA is precipitated using isopropanol after removal of RNA by alkaline hydrolysis to eliminate residual primers.

Second strand cDNA synthesis is conducted using a DNA polymerase, such as Klenow fragment and a primer corresponding to the 5' end of the ligated oligonucleotide. The primer is typically 20-25 bases in length. Methylated dCTP is used for second strand synthesis in order to protect internal EcoRI sites in the cDNA from digestion during the cloning process.

Following second strand synthesis, the full-length cDNAs are cloned into a phagemid vector, such as pBlueScript™ (Stratagene). The ends of the full-length cDNAs are blunted with T4 DNA polymerase (Biolabs) and the cDNA is digested with EcoRI. Since methylated dCTP is used during cDNA synthesis, the EcoRI site present in the tag is the only hemi-methylated site; hence the only site susceptible to EcoRI digestion. In some instances, to facilitate subcloning, an Hind III adapter is added to the 3' end of full-length cDNAs.

The full-length cDNAs are then size fractionated using either exclusion chromatography (AcA, Biosepra) or electrophoretic separation which yields 3 to 6 different fractions. The full-length cDNAs are then directionally cloned either into pBlueScript™ using either the EcoRI and SmaI restriction sites or, when the Hind III adapter is present in the full-length cDNAs, the EcoRI and Hind III restriction sites. The ligation mixture is transformed, preferably by electroporation, into bacteria, which are then propagated under appropriate antibiotic selection.

Clones containing the oligonucleotide tag attached to full-length cDNAs are selected as follows.

The plasmid cDNA libraries made as described above are purified (e.g. by a column available from Qiagen). A positive selection of the tagged clones is performed as follows. Briefly, in this selection procedure, the plasmid DNA is converted to single stranded DNA using phage F1 gene II endonuclease in combination with an exonuclease (Chang et al., *Gene* 127:95 (1993)) such as exonuclease III or T7 gene 6 exonuclease. The resulting single stranded DNA is then purified using paramagnetic beads as described by Fry et al., *Biotechniques* 13: 124 (1992). Here the single stranded DNA is hybridized with a biotinylated oligonucleotide having a sequence corresponding to the 3' end of the oligonucleotide tag. Preferably, the primer has a length of 20-25 bases. Clones including a sequence complementary to the biotinylated

oligonucleotide are selected by incubation with streptavidin coated magnetic beads followed by magnetic capture. After capture of the positive clones, the plasmid DNA is released from the magnetic beads and converted into double stranded DNA using a DNA polymerase such as ThermoSequenase™ (obtained from Amersham Pharmacia Biotech). Alternatively, protocols such as the Gene Trapper™ kit (Gibco BRL) can be used. The double stranded DNA is then transformed, preferably by electroporation, into bacteria. The percentage of positive clones having the 5' tag oligonucleotide is typically estimated to be between 90 and 98% from dot blot analysis.

Following transformation, the libraries are ordered in microtiter plates and sequenced. The *Arabidopsis* library was deposited at the American Type Culture Collection on January 7, 2000 as *E-coli* liba 010600" under the accession number **PTA-1161.**

EXAMPLE 2: SOUTHERN HYBRIDIZATIONS

The SDFs of the invention can be used in Southern hybridizations as described above. The following describes extraction of DNA from nuclei of plant cells, digestion of the nuclear DNA and separation by length, transfer of the separated fragments to membranes, preparation of probes for hybridization, hybridization and detection of the hybridized probe.

The procedures described herein can be used to isolate related polynucleotides or for diagnostic purposes. Moderate stringency hybridization conditions, as defined above, are described in the present example. These conditions result in detection of hybridization between sequences having at least 70% sequence identity. As described above, the hybridization and wash conditions can be changed to reflect the desired percenatge of sequence identity between probe and target sequences that can be detected.

In the following procedure, a probe for hybridization is produced from two PCR reactions using two primers from genomic sequence of *Arabidopsis thaliana.* As described above, the particular template for generating the probe can be any desired template.

The first PCR product is assessed to validate the size of the primer to assure it is of the expected size. Then the product of the first PCR is used as a template, with the same pair of primers used in the first PCR, in a second PCR that produces a labeled product used as the probe.

Fragments detected by hybridization, or other bands of interest, can be isolated from gels used to separate genomic DNA fragments by known methods for further purification and/or characterization.

Buffers for nuclear DNA extraction

1. 10X HB

	1000 ml	
40 mM spermidine	10.2 g	Spermine (Sigma S-2876) and spermidine (Sigma S-2501)
10 mM spermine	3.5 g	Stabilize chromatin and the nuclear membrane
0.1 M EDTA (disodium)	37.2 g	EDTA inhibits nuclease
0.1 M Tris	12.1 g	Buffer
0.8 M KCl	59.6 g	Adjusts ionic strength for stability of nuclei

Adjust pH to 9.5 with 10 N NaOH. It appears that there is a nuclease present in leaves. Use of pH 9.5 appears to inactivate this nuclease.

2. 2 M sucrose (684 g per 1000 ml)

Heat about half the final volume of water to about 50°C. Add the sucrose slowly then bring the mixture to close to final volume; stir constantly until it has dissolved. Bring the solution to volume.

3. Sarkosyl solution (lyses nuclear membranes)

	1000 ml
N-lauroyl sarcosine (Sarkosyl)	20.0 g
0.1 M Tris	12.1 g
0.04 M EDTA (Disodium)	14.9 g

Adjust the pH to 9.5 after all the components are dissolved and bring up to the proper volume.

4. 20% Triton X-100

80 ml Triton X-100

320 ml 1xHB (w/o β-ME and PMSF)

Prepare in advance; Triton takes some time to dissolve

A. Procedure

1. Prepare 1X H" buffer (keep ice-cold during use)

	1000 ml	
10X HB	100 ml	
2 M sucrose	250 ml	a non-ionic osmoticum
Water	634 ml	

Added just before use:

100 mM PMSF*	10 ml a protease inhibitor; protects nuclear membrane proteins
ß-mercaptoethanol	1 ml inactivates nuclease by reducing disulfide bonds

*100 mM PMSF

(phenyl methyl sulfonyl fluoride, Sigma P-7626)

(add 0.0875 g to 5 ml 100% ethanol)

2. Homogenize the tissue in a blender (use 300-400 ml of 1xHB per blender). Be sure that you use 5-10 ml of HB buffer per gram of tissue. Blenders generate heat so be sure to keep the homogenate cold. It is necessary to put the blenders in ice periodically.

3. Add the 20% Triton X-100 (25 ml per liter of homogenate) and gently stir on ice for 20 min. This lyses plastid, but not nuclear, membranes.

4. Filter the tissue suspension through several nylon filters into an ice-cold beaker. The first filtration is through a 250-micron membrane; the second is through an 85-micron membrane; the third is through a 50-micron membrane; and the fourth is through a 20-micron membrane. Use a large funnel to hold the filters. Filtration can be sped up by gently squeezing the liquid through the filters.

5. Centrifuge the filtrate at 1200 x g for 20 min. at 4°C to pellet the nuclei.

6. Discard the dark green supernatant. The pellet will have several layers to it. One is starch; it is white and gritty. The nuclei are gray and soft. In the early steps, there may be a dark green and somewhat viscous layer of chloroplasts.

Wash the pellets in about 25 ml cold H buffer (with Triton X-100) and resuspend by swirling gently and pipetting. After the pellets are resuspended.

Pellet the nuclei again at 1200 - 1300 x g. Discard the supernatant.

Repeat the wash 3-4 times until the supernatant has changed from a dark green to a pale green. This usually happens after 3 or 4 resuspensions. At this point, the pellet is typically grayish white and very slippery. The Triton X-100 in these repeated steps helps to destroy the chloroplasts and mitochondria that contaminate the prep.

Resuspend the nuclei for a final time in a total of 15 ml of H buffer and transfer the suspension to a sterile 125 ml Erlenmeyer flask.

7. Add 15 ml, dropwise, cold 2% Sarkosyl, 0.1 M Tris, 0.04 M EDTA solution (pH 9.5) while swirling gently. This lyses the nuclei. The solution will become very viscous.

8. Add 30 grams of CsCl and gently swirl at room temperature until the CsCl is in solution. The mixture will be gray, white and viscous.

9. Centrifuge the solution at 11,400 x g at 4°C for at least 30 min. The longer this spin is, the firmer the protein pellicle.

0065900-1003900

10. The result is typically a clear green supernatant over a white pellet, and (perhaps) under a protein pellicle. Carefully remove the solution under the protein pellicle and above the pellet. Determine the density of the solution by weighing 1 ml of solution and add CsCl if necessary to bring to 1.57 g/ml. The solution contains dissolved solids (sucrose etc) and the refractive index alone will not be an accurate guide to CsCl concentration.

11. Add 20 µl of 10 mg/ml EtBr per ml of solution.

12. Centrifuge at 184,000 x g for 16 to 20 hours in a fixed-angle rotor.

13. Remove the dark red supernatant that is at the top of the tube with a plastic transfer pipette and discard. Carefully remove the DNA band with another transfer pipette. The DNA band is usually visible in room light; otherwise, use a long wave UV light to locate the band.

14. Extract the ethidium bromide with isopropanol saturated with water and salt. Once the solution is clear, extract at least two more times to ensure that all of the EtBr is gone. Be very gentle, as it is very easy to shear the DNA at this step. This extraction may take a while because the DNA solution tends to be very viscous. If the solution is too viscous, dilute it with TE.

15. Dialyze the DNA for at least two days against several changes (at least three times) of TE (10 mM Tris, 1mM EDTA, pH 8) to remove the cesium chloride.

16. Remove the dialyzed DNA from the tubing. If the dialyzed DNA solution contains a lot of debris, centrifuge the DNA solution at least at 2500 x g for 10 min. and carefully transfer the clear supernatant to a new tube. Read the A260 concentration of the DNA.

17. Assess the quality of the DNA by agarose gel electrophoresis (1% agarose gel) of the DNA. Load 50 ng and 100 ng (based on the OD reading) and compare it with known

and good quality DNA. Undigested lambda DNA and a lambda-HindIII-digested DNA are good molecular weight makers.

Protocol for Digestion of Genomic DNA

Protocol:

1. The relative amounts of DNA for different crop plants that provide approximately a balanced number of genome equivalent is given in Table 3. Note that due to the size of the wheat genome, wheat DNA will be underrepresented. Lambda DNA provides a useful control for complete digestion.

2. Precipitate the DNA by adding 3 volumes of 100% ethanol. Incubate at –20°C for at least two hours. Yeast DNA can be purchased and made up at the necessary concentration, therefore no precipitation is necessary for yeast DNA.

3. Centrifuge the solution at 11,400 x g for 20 min. Decant the ethanol carefully (be careful not to disturb the pellet). Be sure that the residual ethanol is completely removed either by vacuum desiccation or by carefully wiping the sides of the tubes with a clean tissue.

4. Resuspend the pellet in an appropriate volume of water. Be sure the pellet is fully resuspended before proceeding to the next step. This may take about 30 min.

5. Add the appropriate volume of 10X reaction buffer provided by the manufacturer of the restriction enzyme to the resuspended DNA followed by the appropriate volume of enzymes. Be sure to mix it properly by slowly swirling the tubes.

6. Set-up the lambda digestion-control for each DNA that you are digesting.

7. Incubate both the experimental and lambda digests overnight at 37°C. Spin down condensation in a microfuge before proceeding.

8. After digestion, add 2 µl of loading dye (typically 0.25% bromophenol blue, 0.25% xylene cyanol in 15% Ficoll or 30% glycerol) to the lambda-control digests and load

in 1% TPE-agarose gel (TPE is 90 mM Tris-phosphate, 2 mM EDTA, pH 8). If the lambda DNA in the lambda control digests are completely digested, proceed with the precipitation of the genomic DNA in the digests.

9. Precipitate the digested DNA by adding 3 volumes of 100% ethanol and incubating in –20°C for at least 2 hours (preferably overnight).

EXCEPTION: *Arabidopsis* and yeast DNA are digested in an appropriate volume; they don't have to be precipitated.

10. Resuspend the DNA in an appropriate volume of TE (e.g., 22 µl x 50 blots = 1100 µl) and an appropriate volume of 10X loading dye (e.g., 2.4 µl x 50 blots = 120 µl). Be careful in pipetting the loading dye - it is viscous. Be sure you are pipetting the correct volume.

Table 3

Some guide points in digesting genomic DNA.

Species	**Genome Size**	**Size Relative to Arabidopsis**	**Genome Equivalent to 2 µg Arabidopsis DNA**	**Amount of DNA per blot**
Arabidopsis	120 Mb	1X	1X	2 µg
Brassica	1,100 Mb	9.2X	0.54X	10 µg
Corn	2,800 Mb	23.3X	0.43X	20 µg
Cotton	2,300 Mb	19.2X	0.52X	20 µg
Oat	11,300 Mb	94X	0.11X	20 µg
Rice	400 Mb	3.3X	0.75X	5 µg
Soybean	1,100 Mb	9.2X	0.54X	10 µg
Sugarbeet	758 Mb	6.3X	0.8X	10 µg
Sweetclover	1,100 Mb	9.2X	0.54X	10 µg
Wheat	16,000 Mb	133X	0.08X	20 µg

Yeast	15 Mb	0.12X	1X	0.25 µg

Protocol for Southern Blot Analysis

The digested DNA samples are electrophoresed in 1% agarose gels in 1x TPE buffer. Low voltage; overnight separations are preferred. The gels are stained with EtBr and photographed.

1. For blotting the gels, first incubate the gel in 0.25 N HCl (with gentle shaking) for about 15 min.

2. Then briefly rinse with water. The DNA is denatured by 2 incubations. Incubate (with shaking) in 0.5 M NaOH in 1.5 M NaCl for 15 min.

3. The gel is then briefly rinsed in water and neutralized by incubating twice (with shaking) in 1.5 M Tris pH 7.5 in 1.5 M NaCl for 15 min.

4. A nylon membrane is prepared by soaking it in water for at least 5 min, then in 6X SSC for at least 15 min. before use. (20x SSC is 175.3 g NaCl, 88.2 g sodium citrate per liter, adjusted to pH 7.0.)

5. The nylon membrane is placed on top of the gel and all bubbles in between are removed. The DNA is blotted from the gel to the membrane using an absorbent medium, such as paper toweling and 6x SCC buffer. After the transfer, the membrane may be lightly brushed with a gloved hand to remove any agarose sticking to the surface.

6. The DNA is then fixed to the membrane by UV crosslinking and baking at 80°C. The membrane is stored at 4°C until use.

B. Protocol for PCR Amplification of Genomic Fragments in Arabidopsis

Amplification procedures:

1. Mix the following in a 0.20 ml PCR tube or 96-well PCR plate:

09550.0011.00

Volume	Stock	Final Amount or Conc.
0.5 µl	~ 10 ng/µl genomic DNA[1]	5 ng
2.5 µl	**10X PCR buffer**	20 mM Tris, 50 mM KCl
0.75 µl	50 mM $MgCl_2$	1.5 mM
1 µl	10 pmol/µl Primer 1 (Forward)	10 pmol
1 µl	10 pmol/µl Primer 2 (Reverse)	10 pmol
0.5 µl	5 mM dNTPs	0.1 mM
0.1 µl	5 units/µl Platinum Taq™ (Life Technologies, Gaithersburg, MD) DNA Polymerase	1 units
(to 25 µl)	**Water**	

2. The template DNA is amplified using a Perkin Elmer 9700 PCR machine:

1) 94°C for 10 min. followed by

2) 5 cycles:	3) 5 cycles:	4) 25 cycles:
94 °C - 30 sec	94 °C - 30 sec	94 °C - 30 sec
62 °C - 30 sec	58 °C - 30 sec	53 °C - 30 sec
72 °C - 3 min	72 °C - 3 min	72 °C - 3 min

[1] Arabidopsis DNA is used in the present experiment, but the procedure is a general one.

5) 72°C for 7 min. Then the reactions are stopped by chilling to 4°C.

The procedure can be adapted to a multi-well format if necessary.

Quantification and Dilution of PCR Products:

1. The product of the PCR is analyzed by electrophoresis in a 1% agarose gel. A linearized plasmid DNA can be used as a quantification standard (usually at 50, 100, 200, and 400 ng). These will be used as references to approximate the amount of PCR products. HindIII-digested Lambda DNA is useful as a molecular weight marker. The gel can be run fairly quickly; e.g., at 100 volts. The standard gel is examined to determine that the size of the PCR products is consistent with the expected size and if there are significant extra bands or smeary products in the PCR reactions.

2. The amounts of PCR products can be estimated on the basis of the plasmid standard.

3. For the small number of reactions that produce extraneous bands, a small amount of DNA from bands with the correct size can be isolated by dipping a sterile 10-µl tip into the band while viewing though a UV Transilluminator. The small amount of agarose gel (with the DNA fragment) is used in the labeling reaction.

C. Protocol for PCR-DIG-Labeling of DNA

Solutions:

Reagents in PCR reactions (diluted PCR products, 10X PCR Buffer, 50 mM $MgCl_2$, 5 U/µl Platinum Taq Polymerase, and the primers)

10X dNTP + DIG-11-dUTP **[1:5]**: (2 mM dATP, 2 mM dCTP, 2 mM dGTP, 1.65 mM dTTP, 0.35 mM DIG-11-dUTP)

10X dNTP + DIG-11-dUTP **[1:10]**: (2 mM dATP, 2 mM dCTP, 2 mM dGTP, 1.81 mM dTTP, 0.19 mM DIG-11-dUTP)

10X dNTP + DIG-11-dUTP **[1:15]**: (2 mM dATP, 2 mM dCTP, 2 mM dGTP, 1.875 mM dTTP, 0.125 mM DIG-11-dUTP)

TE buffer (10 mM Tris, 1 mM EDTA, pH 8)

Maleate buffer: In 700 ml of deionized distilled water, dissolve 11.61 g maleic acid and 8.77 g NaCl. Add NaOH to adjust the pH to 7.5. Bring the volume to 1 L. Stir for 15 min. and sterilize.

10% blocking solution: In 80 ml deionized distilled water, dissolve 1.16g maleic acid. Next, add NaOH to adjust the pH to 7.5. Add 10 g of the blocking reagent powder (Boehringer Mannheim, Indianapolis, IN, Cat. no. 1096176). Heat to 60°C while stirring to dissolve the powder. Adjust the volume to 100 ml with water. Stir and sterilize.

1% blocking solution: Dilute the 10% stock to 1% using the maleate buffer.

Buffer 3 (100 mM Tris, 100 mM NaCl, 50 mM $MgCl_2$, pH9.5). Prepared from autoclaved solutions of 1M Tris pH 9.5, 5 M NaCl, and 1 M $MgCl_2$ in autoclaved distilled water.

0500500.1500

Procedure:

1. PCR reactions are performed in 25 µl volumes containing:

PCR buffer	1X
$MgCl_2$	1.5 mM
10X dNTP + DIG-11-dUTP	1X (please see the note below)
Platinum Taq™ Polymerase	1 unit
10 pg probe DNA	
10 pmol primer 1	

Note:	Use for:
10X dNTP + DIG-11-dUTP (1:5)	< 1 kb
10X dNTP + DIG-11-dUTP (1:10)	1 kb to 1.8 kb
10X dNTP + DIG-11-dUTP (1:15)	> 1.8 kb

2. The PCR reaction uses the following amplification cycles:

1) 94°C for 10 min.

2)	3)	4)
5 cycles:	5 cycles:	25 cycles:
95°C - 30 sec	95°C - 30 sec	95°C - 30 sec
61°C - 1 min	59°C - 1 min	51°C - 1 min
73°C - 5 min	75°C - 5 min	73°C - 5 min

5) 72°C for 8 min. The reactions are terminated by chilling to 4°C (hold).

3. The products are analyzed by electrophoresis- in a 1% agarose gel, comparing to an aliquot of the unlabelled probe starting material.

4. The amount of DIG-labeled probe is determined as follows:

Make serial dilutions of the diluted control DNA in dilution buffer (TE: 10 mM Tris and 1 mM EDTA, pH 8) as shown in the following table:

DIG-labeled control DNA starting conc.	**Stepwise Dilution**	**Final Conc. (Dilution Name)**
5 ng/µl	1 µl in 49 µl TE	100 pg/µl (A)
100 pg/µl (A)	25 µl in 25 µl TE	50 pg/µl (B)
50 pg/µl (B)	25 µl in 25 µl TE	25 pg/µl (C)
25 pg/µl (C)	20 µl in 30 µl TE	10 pg/µl (D)

a. Serial deletions of a DIG-labeled standard DNA ranging from 100 pg to 10 pg are spotted onto a positively charged nylon membrane, marking the membrane lightly with a pencil to identify each dilution.

b. Serial dilutions (e.g., 1:50, 1:2500, 1:10,000) of the newly labeled DNA probe are spotted.

c. The membrane is fixed by UV crosslinking.

d. The membrane is wetted with a small amount of maleate buffer and then incubated in 1% blocking solution for 15 min at room temp.

e. The labeled DNA is then detected using alkaline phosphatase conjugated anti-DIG antibody (Boehringer Mannheim, Indianapolis, IN, cat. no. 1093274) and an NBT substrate according to the manufacture's instruction.

f. Spot intensities of the control and experimental dilutions are then compared to estimate the concentration of the PCR-DIG-labeled probe.

D. Prehybridization and Hybridization of Southern Blots

Solutions:

100% Formamide purchased from Gibco

20X SSC (1X = 0.15 M NaCl, 0.015 M Na_3citrate)

per L: 175 g NaCl

87.5 g Na_3citrate·2H $_2$0

20% Sarkosyl (N-lauroyl-sarcosine)

20% SDS (sodium dodecyl sulphate)

10% Blocking Reagent: In 80 ml deionized distilled water, dissolve 1.16 g maleic acid. Next, add NaOH to adjust the pH to 7.5. Add 10 g of the blocking reagent powder. Heat to 60°C while stirring to dissolve the powder. Adjust the volume to 100 ml with water. Stir and sterilize.

Docket No. 2750-1237P

Prehybridization Mix:

Final Concentration	**Components**	**Volume (per 100 ml)**	**Stock**
50%	Formamide	50 ml	100%
5X	SSC	25 ml	20X
0.1%	Sarkosyl	0.5 ml	20%
0.02%	SDS	0.1 ml	20%
2%	Blocking Reagent	20 ml	10%
	Water	4.4 ml	

General Procedures:

1. Place the blot in a heat-sealable plastic bag and add an appropriate volume of prehybridization solution (30 ml/100cm^2) at room temperature. Seal the bag with a heat sealer, avoiding bubbles as much as possible. Lay down the bags in a large plastic tray (one tray can accommodate at least 4–5 bags). Ensure that the bags are

lying flat in the tray so that the prehybridization solution is evenly distributed throughout the bag. Incubate the blot for at least 2 hours with gentle agitation using a waver shaker.

2. Denature DIG-labeled DNA probe by incubating for 10 min. at 98°C using the PCR machine and immediately cool it to 4°C.

3. Add probe to prehybridization solution (25 ng/ml; 30 ml = 750 ng total probe) and mix well but avoid foaming. Bubbles may lead to background.

4. Pour off the prehybridization solution from the hybridization bags and add new prehybridization and probe solution mixture to the bags containing the membrane.

5. Incubate with gentle agitation for at least 16 hours.

6. Proceed to medium stringency post-hybridization wash:

Three times for 20 min. each with gentle agitation using 1X SSC, 1% SDS at 60°C.

All wash solutions must be prewarmed to 60°C. Use about 100 ml of wash solution per membrane.

To avoid background keep the membranes fully submerged to avoid drying in spots; agitate sufficiently to avoid having membranes stick to one another.

7. After the wash, proceed to immunological detection and CSPD development.

E. Procedure for Immunological Detection with CSPD

Solutions:

Buffer 1:	Maleic acid buffer (0.1 M maleic acid, 0.15 M NaCl; adjusted to pH 7.5 with NaoH)
Washing buffer:	Maleic acid buffer with 0.3% (v/v) Tween 20.

Blocking stock solution	10% blocking reagent in buffer 1. Dissolve (10X concentration): blocking reagent powder (Boehringer Mannheim, Indianapolis, IN, cat. no. 1096176) by constantly stirring on a 65°C heating block or heat in a microwave, autoclave and store at 4°C.
Buffer 2 (1X blocking solution):	Dilute the stock solution 1:10 in Buffer 1.
Detection buffer:	0.1 M Tris, 0.1 M NaCl, pH 9.5

Procedure:

1. After the post-hybridization wash the blots are briefly rinsed (1-5 min.) in the maleate washing buffer with gentle shaking.

2. Then the membranes are incubated for 30 min. in Buffer 2 with gentle shaking.

3. Anti-DIG-AP conjugate (Boehringer Mannheim, Indianapolis, IN, cat. no. 1093274) at 75 mU/ml (1:10,000) in Buffer 2 is used for detection. 75 ml of solution can be used for 3 blots.

4. The membrane is incubated for 30 min. in the antibody solution with gentle shaking.

5. The membrane are washed twice in washing buffer with gentle shaking. About 250 mls is used per wash for 3 blots.

6. The blots are equilibrated for 2–5 min in 60 ml detection buffer.

7. Dilute CSPD (1:200) in detection buffer. (This can be prepared ahead of time and stored in the dark at 4°C).

The following steps must be done individually. Bags (one for detection and one for exposure) are generally cut and ready before doing the following steps.

Sequence Listing

8. The blot is carefully removed from the detection buffer and excess liquid removed without drying the membrane. The blot is immediately placed in a bag and 1.5 ml of CSPD solution is added. The CSPD solution can be spread over the membrane. Bubbles present at the edge and on the surface of the blot are typically removed by gentle rubbing. The membrane is incubated for 5 min. in CSPD solution.

9. Excess liquid is removed and the membrane is blotted briefly (DNA side up) on Whatman 3MM paper. Do not let the membrane dry completely.

10. Seal the damp membrane in a hybridization bag and incubate for 10 min at 37°C to enhance the luminescent reaction.

11. Expose for 2 hours at room temperature to X-ray film. Multiple exposures can be taken. Luminescence continues for at least 24 hours and signal intensity increases during the first hours.

Example 3: Transformation of Carrot Cells

Transformation of plant cells can be accomplished by a number of methods, as described above. Similarly, a number of plant genera can be regenerated from tissue culture following transformation. Transformation and regeneration of carrot cells as described herein is illustrative.

Single cell suspension cultures of carrot (*Daucus carota*) cells are established from hypocotyls of cultivar Early Nantes in B_5 growth medium (O.L. Gamborg et al., *Plant Physiol.* 45:372 (1970)) plus 2,4-D and 15 mM $CaCl_2$ (B_5 -44 medium) by methods known in the art. The suspension cultures are subcultured by adding 10 ml of the suspension culture to 40 ml of B_5-44 medium in 250 ml flasks every 7 days and are maintained in a shaker at 150 rpm at 27 °C in the dark.

The suspension culture cells are transformed with exogenous DNA as described by Z. Chen et al. *Plant Mol. Bio.* 36:163 (1998). Briefly, 4-days post-subculture cells are incubated with cell wall digestion solution containing 0.4 M sorbitol, 2% driselase, 5mM MES (2-[N-Morpholino] ethanesulfonic acid) pH 5.0 for 5 hours. The digested cells are pelleted gently at 60 xg for 5 min. and washed twice in W5 solution containing 154 mM NaCl, 5 mM KCl, 125 mM $CaCl_2$ and 5mM glucose, pH 6.0. The protoplasts are suspended in MC solution

containing 5 mM MES, 20 mM $CaCl_2$, 0.5 M mannitol, pH 5.7 and the protoplast density is adjusted to about 4 x 10^6 protoplasts per ml.

15-60 μg of plasmid DNA is mixed with 0.9 ml of protoplasts. The resulting suspension is mixed with 40% polyethylene glycol (MW 8000, PEG 8000), by gentle inversion a few times at room temperature for 5 to 25 min. Protoplast culture medium known in the art is added into the PEG-DNA-protoplast mixture. Protoplasts are incubated in the culture medium for 24 hour to 5 days and cell extracts can be used for assay of transient expression of the introduced gene. Alternatively, transformed cells can be used to produce transgenic callus, which in turn can be used to produce transgenic plants, by methods known in the art. See, for example, Nomura and Komamine, *Plt. Phys.* 79:988-991 (1985), *Identification and Isolation of Single Cells that Produce Somatic Embryos in Carrot Suspension Cultures.*

An additional deposit of an *E. coli* Library, *E. coli*LibA021800, was made at the American Type Culture Collection in Manassas, Virginia, USA on February 22, 2000 to meet the requirements of Budapest Treaty for the international recognition of the deposit of microorganisms.

The invention being thus described, it will be apparent to one of ordinary skill in the art that various modifications of the materials and methods for practicing the invention can be made. Such modifications are to be considered within the scope of the invention as defined by the following claims.

Each of the references from the patent and periodical literature cited herein is hereby expressly incorporated in its entirety by such citation.

P5000-1237P

CLAIMS

What is claimed is:

1. An isolated nucleic acid molecule comprising a nucleic acid having a nucleotide sequence which encodes an amino acid sequence exhibiting at least 40% sequence identity to an amino acid sequence encoded by

(a) a nucleotide sequence described in Tables 1 and/or 2 or a fragment thereof; or

(b) a complement of a nucleotide sequence shown in Tables 1 and/or 2 or a fragment thereof.

2. An isolated nucleic acid molecule comprising a nucleic acid having a nucleotide sequence which exhibits at least 65% sequence identity to

(a) a nucleotide sequence shown in Tables 1 and/or 2 or a fragment thereof; or

(b) a complement of a nucleotide sequence described in Tables 1 and/or 2 or a fragment thereof.

3. An isolated nucleic acid molecule comprising a nucleic acid having a nucleotide sequence which exhibits at least 65% sequence identity to a gene comprising

(a) a nucleotide sequence shown in Tables 1 and/or 2 or a fragment thereof; or

(b) a complement of a nucleotide sequence described in Tables 1 and/or 2 or a fragment thereof.

4. An isolated nucleic acid molecule which is the reverse of the isolated nucleotide sequence according to claim 1, such that the reverse nucleotide sequence has a sequence order which is the reverse of the sequence order of said isolated nucleotide sequence according to claim 1.

5. An isolated nucleic acid molecule comprising a nucleic acid capable of hybridizing to a nucleic acid having a sequence selected from the group consisting of:

(a) a nucleotide sequence which is shown in Tables 1 and/or 2; and

(b) a nucleotide sequence which is complementary to a nucleotide sequence shown in Tables 1 and/or 2;

under conditions that permit formation of a nucleic acid duplex at a temperature from about 40°C and 48°C below the melting temperature of the nucleic acid duplex.

6. The nucleic acid molecule according to claim 1, wherein said nucleic acid comprises an open reading frame.

Docket No. 2750-1237P

7. The isolated nucleic acid molecule of claim 1, wherein said nucleic acid is capable of functioning as a promoter, a 3' end termination sequence, an untranslated region (UTR), or as a regulatory sequence.

8. The isolated nucleic acid molecule of claim 7, wherein said nucleic acid is a promoter and comprises a sequence selected from the group consisting of a TATA box sequence, a CAAT box sequence, a motif of GCAATCG or any transcription-factor binding sequence, and any combination thereof.

9. The isolated nucleic acid molecule of claim 7, wherein the nucleic acid sequence is a regulatory sequence which is capable of promoting seed-specific expression, embryo-specific expression, ovule-specific expression, tapetum-specific expression or root-specific expression of a sequence or any combination thereof.

10. A vector construct comprising a nucleic acid molecule according to claim 1, wherein said nucleic acid molecule is heterologous to any element in said vector construct.

11. A vector construct comprising:

(a) a first nucleic acid having a regulatory sequence capable of causing transcription and/or translation; and

(b) a second nucleic acid having the sequence of the isolated nucleic acid molecule according to claim 1;

wherein said first and second nucleic acids are operably linked and

wherein said second nucleic acid is heterologous to any element in said vector construct.

12. The vector construct according to claim 11, wherein said first nucleic acid is native to said second nucleic acid.

13. The vector construct according to claim 11, wherein said first nucleic acid is heterologous to said second nucleic acid.

14. A vector construct comprising:

(c) a first nucleic acid having the sequence of the isolated nucleic acid molecule according to claim 7; and

(d) a second nucleic acid;

wherein said first and second nucleic acids are operably linked and

wherein said first nucleic acid is heterologous to any element in said vector construct.

15. The vector construct according to claim 14, wherein said first nucleic acid is native to said second nucleic acid.

16. The vector construct according to claim 14, wherein said first nucleic acid is heterologous to said second nucleic acid.

Docket No. 2750-1237P

17. A host cell comprising an isolated nucleic acid molecule according to claim 1, wherein said nucleic acid molecule is flanked by exogenous sequence.

18. A host cell comprising a vector construct of claim 10.

19. A host cell comprising a vector construct of claim 11.

20. A host cell comprising a vector construct of claim 12.

21. A host cell comprising a vector construct of claim 13.

22. A host cell comprising a vector construct of claim 14.

23. A host cell comprising a vector construct of claim 15.

24. A host cell comprising a vector construct of claim 16.

25. An isolated polypeptide comprising an amino acid sequence

(a) exhibiting at least 40% sequence identity of an amino acid sequence encoded by a sequence shown in Tables 1 and/or 2 or a fragment thereof; and

(b) capable of exhibiting at least one of the biological activities of the polypeptide encoded by said nucleotide sequence shown in Tables 1 and/or 2 or a fragment thereof.

26. The isolated polypeptide of claim 25, wherein said amino acid sequence exhibits at least 75% sequence identity to an amino acid sequence encoded by a sequence shown in Tables 1 and/or 2 or a fragment thereof.

27. The isolated polypeptide of claim 25, wherein said amino acid sequence exhibits at least 85% sequence identity to an amino acid sequence encoded by a sequence shown in Tables 1 and/or 2 or a fragment thereof.

28. The isolated polypeptide of claim 25, wherein said amino acid sequence exhibits at least 90% sequence identity to an amino acid sequence encoded by a sequence shown in Tables 1 and/or 2 or a fragment thereof.

29. An antibody capable of binding the isolated polypeptide of claim 25.

30. A method of introducing an isolated nucleic acid into a host cell comprising:

(a) providing an isolated nucleic acid molecule according to claim 1; and

(b) contacting said isolated nucleic with said host cell under conditions that permit insertion of said nucleic acid into said host cell.

31. A method of transforming a host cell which comprises contacting a host cell with a vector construct according to claim 10.

32. A method of transforming a host cell which comprises contacting a host cell with a vector construct according to claim 11.

33. A method of transforming a host cell which comprises contacting a host cell with a vector construct according to claim 12.

34. A method of transforming a host cell which comprises contacting a host cell with a vector construct according to claim 13.

35. A method of transforming a host cell which comprises contacting a host cell with a vector construct according to claim 14.

36. A method of transforming a host cell which comprises contacting a host cell with a vector construct according to claim 15.

37. A method of transforming a host cell which comprises contacting a host cell with a vector construct according to claim 16.

38. A method of modulating transcription and/or translation of a nucleic acid in a host cell comprising:

(a) providing the host cell of claim 17; and

(b) culturing said host cell under conditions that permit transcription or translation.

39. A method for detecting a nucleic acid in a sample which comprises:

(a) providing an isolated nucleic acid molecule according to claim 1;

(b) contacting said isolated nucleic acid molecule with a sample under conditions which permit a comparison of the sequence of said isolated nucleic acid molecule with the sequence of DNA in said sample; and

(c) analyzing the result of said comparison.

40. The method according to claim 39, wherein said isolated nucleic acid molecule and said sample are contacted under conditions which permit the formation of a duplex between complementary nucleic acid sequences.

41. A plant or cell of a plant which comprises a nucleic acid molecule according to claim 1 which is exogenous to said plant or plant cell.

42. A plant or cell of a plant which comprises a nucleic acid molecule according to claim 1, wherein said nucleic acid molecule is heterologous to said plant or said cell of a plant.

43. A plant or cell of a plant which has been transformed with a nucleic acid molecule according to claim 1.

44. A plant or cell of a plant which comprises a vector construct according to claim 10.

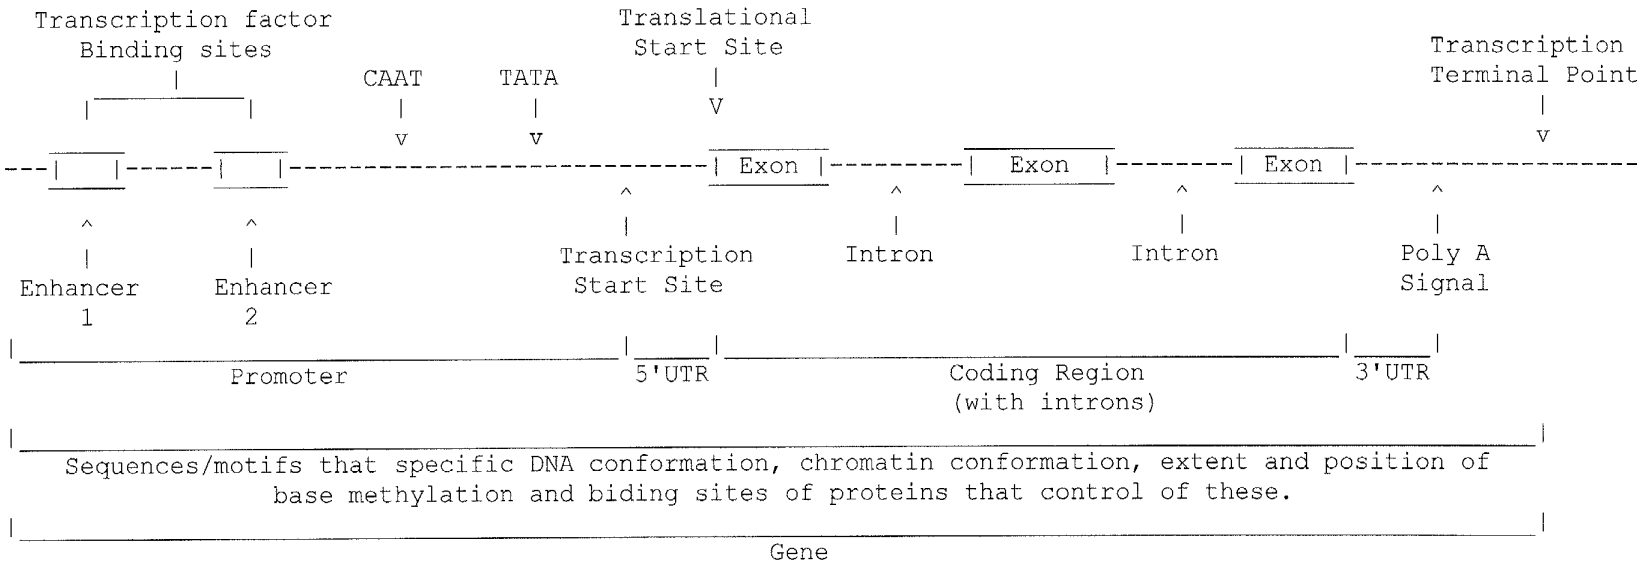
Doc: 1237P.050

45. A plant or cell of a plant which has been transformed with a vector construct according to claim 10.

46. A plant which has been regenerated from a plant cell according to claim 41.

47. A plant which has been regenerated from a plant cell according to claim 42.

48. A plant which has been regenerated from a plant cell according to claim 43.



49. A plant which has been regenerated from a plant cell according to claim 44.

50. A plant which has been regenerated from a plant cell according to claim 45.

Doc#: 6504500 - 06/04/2002

SCHEMATIC 1

SCHEMATIC OF A GENE

ABSTRACT OF THE DISCLOSURE

The present invention provides DNA molecules that constitute fragments of the genome of a plant, and polypeptides encoded thereby. The DNA molecules are useful for specifying a gene product in cells, either as a promoter or as a protein coding sequence or as an UTR or as a 3' termination sequence, and are also useful in controlling the behavior of a gene in the chromosome, in controlling the expression of a gene or as tools for genetic mapping, recognizing or isolating identical or related DNA fragments, or identification of a particular individual organism, or for clustering of a group of organisms with a common trait.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 263
- gi No. 3327392
- Description: (AC004483) reverse-transcriptase-like protein [Arabidopsis thaliana]
- % Identity: 91.7
- Alignment Length: 12
- Location of Alignment in SEQ ID NO 513: from 117 to 128

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 514
- Ceres seq_id 1586441
- Location of start within SEQ ID NO 511: at 71 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 264
- gi No. 3327392
- Description: (AC004483) reverse-transcriptase-like protein [Arabidopsis thaliana]
- % Identity: 91.7
- Alignment Length: 12
- Location of Alignment in SEQ ID NO 514: from 99 to 110

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 515
- Ceres seq_id 1586467

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 516
- Ceres seq_id 1586468
- Location of start within SEQ ID NO 515: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Myb-like DNA-binding domain
- Location within SEQ ID NO 516: from 15 to 54 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 265
- gi No. 1732513
- Description: (U62743) snapdragon myb protein 305 homolog [Arabidopsis thaliana]
- % Identity: 77.4
- Alignment Length: 31
- Location of Alignment in SEQ ID NO 516: from 33 to 63

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 517
- Ceres seq_id 1586469
- Location of start within SEQ ID NO 515: at 91 nt.

DOCKET NO. 2750-1237P

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 266
- gi No. 1732513
- Description: (U62743) snapdragon myb protein 305 homolog [Arabidopsis thaliana]
- % Identity: 77.4
- Alignment Length: 31
- Location of Alignment in SEQ ID NO 517: from 3 to 33

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 518
- Ceres seq_id 1586470

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 519
- Ceres seq_id 1586471
- Location of start within SEQ ID NO 518: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Myb-like DNA-binding domain
- Location within SEQ ID NO 519: from 15 to 54 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 267
- gi No. 1732513
- Description: (U62743) snapdragon myb protein 305 homolog [Arabidopsis thaliana]
- % Identity: 77.4
- Alignment Length: 31
- Location of Alignment in SEQ ID NO 519: from 33 to 63

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 520
- Ceres seq_id 1586472
- Location of start within SEQ ID NO 518: at 91 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 268
- gi No. 1732513
- Description: (U62743) snapdragon myb protein 305 homolog [Arabidopsis thaliana]
- % Identity: 77.4
- Alignment Length: 31
- Location of Alignment in SEQ ID NO 520: from 3 to 33

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 521
- Ceres seq_id 1586546

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 522
- Ceres seq_id 1586547
- Location of start within SEQ ID NO 521: at 1 nt.

09609609 - 100300

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- TPR Domain
- Location within SEQ ID NO 522: from 75 to 103 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 269
- gi No. 5281051
- Description: (AL080318) stress-induced protein sti1-like protein [Arabidopsis thaliana]
- % Identity: 91.8
- Alignment Length: 122
- Location of Alignment in SEQ ID NO 522: from 1 to 120

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 523
- Ceres seq_id 1586548
- Location of start within SEQ ID NO 521: at 55 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- TPR Domain
- Location within SEQ ID NO 523: from 57 to 85 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 270
- gi No. 5281051
- Description: (AL080318) stress-induced protein sti1-like protein [Arabidopsis thaliana]
- % Identity: 91.8
- Alignment Length: 122
- Location of Alignment in SEQ ID NO 523: from 1 to 102

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 524
- Ceres seq_id 1586549
- Location of start within SEQ ID NO 521: at 118 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- TPR Domain
- Location within SEQ ID NO 524: from 36 to 64 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 271
- gi No. 5281051
- Description: (AL080318) stress-induced protein sti1-like protein [Arabidopsis thaliana]
- % Identity: 91.8
- Alignment Length: 122
- Location of Alignment in SEQ ID NO 524: from 1 to 81

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 525
- Ceres seq_id 1586602

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 526
- Ceres seq_id 1586603
- Location of start within SEQ ID NO 525: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- E1-E2 ATPases
- Location within SEQ ID NO 526: from 583 to 669 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 527
- Ceres seq_id 1586604
- Location of start within SEQ ID NO 525: at 83 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- E1-E2 ATPases
- Location within SEQ ID NO 527: from 556 to 642 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 528
- Ceres seq_id 1586605
- Location of start within SEQ ID NO 525: at 260 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- E1-E2 ATPases
- Location within SEQ ID NO 528: from 497 to 583 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 529
- Ceres seq_id 1586689

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 530
- Ceres seq_id 1586690
- Location of start within SEQ ID NO 529: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 272
- gi No. 2134213
- Description: protamine I - American alligator
- % Identity: 75
- Alignment Length: 16
- Location of Alignment in SEQ ID NO 530: from 23 to 38

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 531
- Ceres seq_id 1586691
- Location of start within SEQ ID NO 529: at 3 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 273

- gi No. 392799
- Description: (U00691) G5/D6 ORF [Dictyostelium discoideum]
- % Identity: 76
- Alignment Length: 25
- Location of Alignment in SEQ ID NO 531: from 1 to 25

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 532
- Ceres seq_id 1586696

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 533
- Ceres seq_id 1586697
- Location of start within SEQ ID NO 532: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 274
- gi No. 4325351
- Description: (AF128394) similar to Antirrhinum majus (garden snapdragon) TNP2 protein (GB:X57297) [Arabidopsis thaliana]
- % Identity: 79.7
- Alignment Length: 188
- Location of Alignment in SEQ ID NO 533: from 59 to 234

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 534
- Ceres seq_id 1586699
- Location of start within SEQ ID NO 532: at 40 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 275
- gi No. 4325351
- Description: (AF128394) similar to Antirrhinum majus (garden snapdragon) TNP2 protein (GB:X57297) [Arabidopsis thaliana]
- % Identity: 79.7
- Alignment Length: 188
- Location of Alignment in SEQ ID NO 534: from 46 to 221

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 535
- Ceres seq_id 1587283

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 536
- Ceres seq_id 1587284
- Location of start within SEQ ID NO 535: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 276
- gi No. 3695382
- Description: (AF096370) contains similarity to Arabidopsis thaliana retrotransposon Ta11-1 (GB:L47193) [Arabidopsis thaliana]
- % Identity: 71

09505360.1

- Alignment Length: 186
- Location of Alignment in SEQ ID NO 536: from 8 to 193

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 537
- Ceres seq_id 1587286
- Location of start within SEQ ID NO 535: at 133 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 277
- gi No. 3695382
- Description: (AF096370) contains similarity to Arabidopsis thaliana retrotransposon Ta11-1 (GB:L47193) [Arabidopsis thaliana]
- % Identity: 71
- Alignment Length: 186
- Location of Alignment in SEQ ID NO 537: from 1 to 149

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 538
- Ceres seq_id 1587308

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 539
- Ceres seq_id 1587309
- Location of start within SEQ ID NO 538: at 181 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 278
- gi No. 2244924
- Description: (Z97339) glutaredoxin [Arabidopsis thaliana]
- % Identity: 74.5
- Alignment Length: 102
- Location of Alignment in SEQ ID NO 539: from 1 to 102

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 540
- Ceres seq_id 1587310
- Location of start within SEQ ID NO 538: at 187 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 279
- gi No. 2244924
- Description: (Z97339) glutaredoxin [Arabidopsis thaliana]
- % Identity: 74.5
- Alignment Length: 102
- Location of Alignment in SEQ ID NO 540: from 1 to 100

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 541
- Ceres seq_id 1587311
- Location of start within SEQ ID NO 538: at 199 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 280
- gi No. 2244924
- Description: (Z97339) glutaredoxin [Arabidopsis thaliana]
- % Identity: 74.5
- Alignment Length: 102
- Location of Alignment in SEQ ID NO 541: from 1 to 96

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 542
- Ceres seq_id 1587406

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 543
- Ceres seq_id 1587407
- Location of start within SEQ ID NO 542: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 544
- Ceres seq_id 1587409
- Location of start within SEQ ID NO 542: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 281
- gi No. 3021336
- Description: (AJ224957) RGA-like [Arabidopsis thaliana]
- % Identity: 83.3
- Alignment Length: 30
- Location of Alignment in SEQ ID NO 544: from 3 to 32

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 545
- Ceres seq_id 1587537

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 546
- Ceres seq_id 1587538
- Location of start within SEQ ID NO 545: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Integrase
- Location within SEQ ID NO 546: from 27 to 131 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 547
- Ceres seq_id 1587539
- Location of start within SEQ ID NO 545: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 548
- Ceres seq_id 1587540

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 549
- Ceres seq_id 1587541
- Location of start within SEQ ID NO 548: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 282
- gi No. 3377846
- Description: (AF076274) No definition line found [Arabidopsis thaliana]
- % Identity: 83.6
- Alignment Length: 67
- Location of Alignment in SEQ ID NO 549: from 620 to 685

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 550
- Ceres seq_id 1587543
- Location of start within SEQ ID NO 548: at 262 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 283
- gi No. 3377846
- Description: (AF076274) No definition line found [Arabidopsis thaliana]
- % Identity: 83.6
- Alignment Length: 67
- Location of Alignment in SEQ ID NO 550: from 533 to 598

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 551
- Ceres seq_id 1587563

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 552
- Ceres seq_id 1587564
- Location of start within SEQ ID NO 551: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 284
- gi No. 1086591
- Description: (U41007) similar to S. cervisiae nuclear protein SNF2 (SP:P22082) in a a region of gly-arg repeats [Caenorhabditis elegans]
- % Identity: 81.3
- Alignment Length: 16
- Location of Alignment in SEQ ID NO 552: from 98 to 113

(B) Polypeptide Sequence

09609360.1-1-3000

- Pat. Appln. SEQ ID NO 553
- Ceres seq_id 1587565
- Location of start within SEQ ID NO 551: at 7 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 285
- gi No. 1086591
- Description: (U41007) similar to S. cervisiae nuclear protein SNF2 (SP:P22082) in a a region of gly-arg repeats [Caenorhabditis elegans]
- % Identity: 81.3
- Alignment Length: 16
- Location of Alignment in SEQ ID NO 553: from 96 to 111

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 554
- Ceres seq_id 1587566
- Location of start within SEQ ID NO 551: at 64 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 286
- gi No. 1086591
- Description: (U41007) similar to S. cervisiae nuclear protein SNF2 (SP:P22082) in a a region of gly-arg repeats [Caenorhabditis elegans]
- % Identity: 81.3
- Alignment Length: 16
- Location of Alignment in SEQ ID NO 554: from 77 to 92

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 555
- Ceres seq_id 1587579

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 556
- Ceres seq_id 1587580
- Location of start within SEQ ID NO 555: at 3 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Oxidoreductase FAD/NAD-binding domain
- Location within SEQ ID NO 556: from 1 to 78 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 287
- gi No. 3913653
- Description: FERREDOXIN--NADP REDUCTASE, EMBRYO ISOZYME PRECURSOR (FNR) >gi|1778686|dbj|BAA13417| (D87547) precursor ferredoxin-NADP+ oxidoreductase [Oryza sativa]
- % Identity: 88.9
- Alignment Length: 108
- Location of Alignment in SEQ ID NO 556: from 1 to 108

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 557
- Ceres seq_id 1587581
- Location of start within SEQ ID NO 555: at 120 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

- Alignment No. 288
- gi No. 3913653
- Description: FERREDOXIN--NADP REDUCTASE, EMBRYO ISOZYME PRECURSOR (FNR) >gi|1778686|dbj|BAA13417| (D87547) precursor ferredoxin-NADP+ oxidoreductase [Oryza sativa]
- % Identity: 88.9
- Alignment Length: 108
- Location of Alignment in SEQ ID NO 557: from 1 to 69

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence

- Pat. Appln. SEQ ID NO 558
- Ceres seq_id 1587594

(B) Polypeptide Sequence

- Pat. Appln. SEQ ID NO 559
- Ceres seq_id 1587595
- Location of start within SEQ ID NO 558: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

- Glycosyl transferases
- Location within SEQ ID NO 559: from 171 to 347 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence

- Pat. Appln. SEQ ID NO 560
- Ceres seq_id 1587597
- Location of start within SEQ ID NO 558: at 517 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

- Glycosyl transferases
- Location within SEQ ID NO 560: from 1 to 175 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence

- Pat. Appln. SEQ ID NO 561
- Ceres seq_id 1587598

(B) Polypeptide Sequence

- Pat. Appln. SEQ ID NO 562
- Ceres seq_id 1587599
- Location of start within SEQ ID NO 561: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

- Glycosyl transferases
- Location within SEQ ID NO 562: from 227 to 403 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence

- Pat. Appln. SEQ ID NO 563
- Ceres seq_id 1587601

09868900 - 040900

- Location of start within SEQ ID NO 561: at 610 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Glycosyl transferases
- Location within SEQ ID NO 563: from 24 to 200 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 564
- Ceres seq_id 1587617

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 565
- Ceres seq_id 1587618
- Location of start within SEQ ID NO 564: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Tropomyosins
- Location within SEQ ID NO 565: from 287 to 461 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 289
- gi No. 2435616
- Description: (AF026215) No definition line found [Caenorhabditis elegans]
- % Identity: 71.4
- Alignment Length: 14
- Location of Alignment in SEQ ID NO 565: from 559 to 572

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 566
- Ceres seq_id 1587620
- Location of start within SEQ ID NO 564: at 121 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Tropomyosins
- Location within SEQ ID NO 566: from 247 to 421 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 290
- gi No. 2435616
- Description: (AF026215) No definition line found [Caenorhabditis elegans]
- % Identity: 71.4
- Alignment Length: 14
- Location of Alignment in SEQ ID NO 566: from 519 to 532

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 567
- Ceres seq_id 1587654

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 568
- Ceres seq_id 1587655
- Location of start within SEQ ID NO 567: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- NB-ARC domain
- Location within SEQ ID NO 568: from 188 to 343 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 569
- Ceres seq_id 1587657
- Location of start within SEQ ID NO 567: at 154 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- NB-ARC domain
- Location within SEQ ID NO 569: from 137 to 292 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 570
- Ceres seq_id 1587778

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 571
- Ceres seq_id 1587779
- Location of start within SEQ ID NO 570: at 3 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 291
- gi No. 4914316
- Description: (AC005489) F14N23.2 [Arabidopsis thaliana]
- % Identity: 74.6
- Alignment Length: 68
- Location of Alignment in SEQ ID NO 571: from 1 to 67

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 572
- Ceres seq_id 1587780
- Location of start within SEQ ID NO 570: at 15 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 292
- gi No. 4914316
- Description: (AC005489) F14N23.2 [Arabidopsis thaliana]

- Alignment Length: 68
- Location of Alignment in SEQ ID NO 572: from 1 to 63

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 573
- Ceres seq_id 1587781
- Location of start within SEQ ID NO 570: at 230 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 574
- Ceres seq_id 1587821

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 575
- Ceres seq_id 1587822
- Location of start within SEQ ID NO 574: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 293
- gi No. 3047073
- Description: (AF058825) contains similarity to retrotransposon-like proteins [Arabidopsis thaliana]
- % Identity: 89.9
- Alignment Length: 119
- Location of Alignment in SEQ ID NO 575: from 45 to 163

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 576
- Ceres seq_id 1587823
- Location of start within SEQ ID NO 574: at 10 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 294
- gi No. 3047073
- Description: (AF058825) contains similarity to retrotransposon-like proteins [Arabidopsis thaliana]
- % Identity: 89.9
- Alignment Length: 119
- Location of Alignment in SEQ ID NO 576: from 42 to 160

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 577
- Ceres seq_id 1587824
- Location of start within SEQ ID NO 574: at 133 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 295
- gi No. 3047073
- Description: (AF058825) contains similarity to retrotransposon-like proteins [Arabidopsis thaliana]
- % Identity: 89.9
- Alignment Length: 119
- Location of Alignment in SEQ ID NO 577: from 1 to 119

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 578

- Ceres seq_id 1587825

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 579
- Ceres seq_id 1587826
- Location of start within SEQ ID NO 578: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 296
- gi No. 3047073
- Description: (AF058825) contains similarity to retrotransposon-like proteins [Arabidopsis thaliana]
- % Identity: 83.3
- Alignment Length: 30
- Location of Alignment in SEQ ID NO 579: from 96 to 124

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 580
- Ceres seq_id 1587913

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 581
- Ceres seq_id 1587914
- Location of start within SEQ ID NO 580: at 3 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Fibrillarin
- Location within SEQ ID NO 581: from 60 to 292 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 297
- gi No. 4914455
- Description: (AL050400) fibrillarin-like protein [Arabidopsis thaliana]
- % Identity: 91.4
- Alignment Length: 305
- Location of Alignment in SEQ ID NO 581: from 1 to 298

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 582
- Ceres seq_id 1587915
- Location of start within SEQ ID NO 580: at 168 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Fibrillarin
- Location within SEQ ID NO 582: from 5 to 237 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 298
- gi No. 4914455
- Description: (AL050400) fibrillarin-like protein [Arabidopsis thaliana]

(Dp) Related Amino Acid Sequences
- Alignment No. 405
- gi No. 5459298
- Description: (Y17722) telomere repeat-binding protein TRP1 [Arabidopsis thaliana]
- % Identity: 72.7
- Alignment Length: 55
- Location of Alignment in SEQ ID NO 793: from 54 to 108

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 794
- Ceres seq_id 1593815

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 795
- Ceres seq_id 1593816
- Location of start within SEQ ID NO 794: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Eukaryotic protein kinase domain
- Location within SEQ ID NO 795: from 1 to 166 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 406
- gi No. 3236253
- Description: (AC004684) receptor-like protein kinase [Arabidopsis thaliana]
- % Identity: 79.5
- Alignment Length: 224
- Location of Alignment in SEQ ID NO 795: from 1 to 224

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 796
- Ceres seq_id 1593817

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 797
- Ceres seq_id 1593818
- Location of start within SEQ ID NO 796: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Phosphatidylinositol 3- and 4-kinases
- Location within SEQ ID NO 797: from 113 to 206 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 407
- gi No. 4467359
- Description: (AJ002685) Phosphatidylinositol 4-kinase [Arabidopsis thaliana]
- % Identity: 89.8
- Alignment Length: 206
- Location of Alignment in SEQ ID NO 797: from 1 to 206

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 798
- Ceres seq_id 1593819
- Location of start within SEQ ID NO 796: at 50 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Phosphatidylinositol 3- and 4-kinases
- Location within SEQ ID NO 798: from 97 to 190 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 408
- gi No. 4467359
- Description: (AJ002685) Phosphatidylinositol 4-kinase [Arabidopsis thaliana]
- % Identity: 89.8
- Alignment Length: 206
- Location of Alignment in SEQ ID NO 798: from 1 to 190

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 799
- Ceres seq_id 1593820
- Location of start within SEQ ID NO 796: at 212 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Phosphatidylinositol 3- and 4-kinases
- Location within SEQ ID NO 799: from 43 to 136 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 409
- gi No. 4467359
- Description: (AJ002685) Phosphatidylinositol 4-kinase [Arabidopsis thaliana]
- % Identity: 89.8
- Alignment Length: 206
- Location of Alignment in SEQ ID NO 799: from 1 to 136

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 800
- Ceres seq_id 1593869

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 801
- Ceres seq_id 1593870
- Location of start within SEQ ID NO 800: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Prokaryotic-type class I peptide chain release factors
- Location within SEQ ID NO 801: from 74 to 185 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 802
- Ceres seq_id 1593872
- Location of start within SEQ ID NO 800: at 10 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Prokaryotic-type class I peptide chain release factors
- Location within SEQ ID NO 802: from 71 to 182 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 803
- Ceres seq_id 1593876

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 804
- Ceres seq_id 1593877
- Location of start within SEQ ID NO 803: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 854
- Ceres seq_id 1594667

(B) Polypeptide Sequence

09509509.1-1505-030500

- Pat. Appln. SEQ ID NO 855
- Ceres seq_id 1594668
- Location of start within SEQ ID NO 854: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- ABC transporter
- Location within SEQ ID NO 855: from 79 to 271 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 856
- Ceres seq_id 1594670
- Location of start within SEQ ID NO 854: at 28 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- ABC transporter
- Location within SEQ ID NO 856: from 70 to 262 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 857
- Ceres seq_id 1594695

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 858
- Ceres seq_id 1594696
- Location of start within SEQ ID NO 857: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 434
- gi No. 283004
- Description: DNA-binding protein Gt-2 - rice >gi|20249|emb|CAA48328| (X68261) gt-2 [Oryza sativa]
- % Identity: 72.9
- Alignment Length: 48
- Location of Alignment in SEQ ID NO 858: from 5 to 52

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 859
- Ceres seq_id 1594697
- Location of start within SEQ ID NO 857: at 5 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 435
- gi No. 283004
- Description: DNA-binding protein Gt-2 - rice >gi|20249|emb|CAA48328| (X68261) gt-2 [Oryza sativa]
- % Identity: 72.9
- Alignment Length: 48
- Location of Alignment in SEQ ID NO 859: from 4 to 51

(B) Polypeptide Sequence

DC5C-HOUSTON

- Pat. Appln. SEQ ID NO 860
- Ceres seq_id 1594698
- Location of start within SEQ ID NO 857: at 206 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 861
- Ceres seq_id 1594699

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 862
- Ceres seq_id 1594700
- Location of start within SEQ ID NO 861: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 436
- gi No. 283004
- Description: DNA-binding protein Gt-2 - rice >gi|20249|emb|CAA48328| (X68261) gt-2 [Oryza sativa]
- % Identity: 72.9
- Alignment Length: 48
- Location of Alignment in SEQ ID NO 862: from 5 to 52

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 863
- Ceres seq_id 1594701
- Location of start within SEQ ID NO 861: at 5 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 437
- gi No. 283004
- Description: DNA-binding protein Gt-2 - rice >gi|20249|emb|CAA48328| (X68261) gt-2 [Oryza sativa]
- % Identity: 72.9
- Alignment Length: 48
- Location of Alignment in SEQ ID NO 863: from 4 to 51

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 864
- Ceres seq_id 1594702
- Location of start within SEQ ID NO 861: at 206 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 865
- Ceres seq_id 1594703

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 866

DOCSNY-1405900

- Ceres seq_id 1594704
- Location of start within SEQ ID NO 865: at 3 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 438
- gi No. 3249065
- Description: (AC004473) Similar to HAK1 gb|U22945 high affinity potassium transporter from Schwanniomyces occidentalis. [Arabidopsis thaliana]
- % Identity: 72.7
- Alignment Length: 44
- Location of Alignment in SEQ ID NO 866: from 122 to 165

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 867
- Ceres seq_id 1594705
- Location of start within SEQ ID NO 865: at 21 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 439
- gi No. 3249065
- Description: (AC004473) Similar to HAK1 gb|U22945 high affinity potassium transporter from Schwanniomyces occidentalis. [Arabidopsis thaliana]
- % Identity: 72.7
- Alignment Length: 44
- Location of Alignment in SEQ ID NO 867: from 116 to 159

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 868
- Ceres seq_id 1594706
- Location of start within SEQ ID NO 865: at 24 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 440
- gi No. 3249065
- Description: (AC004473) Similar to HAK1 gb|U22945 high affinity potassium transporter from Schwanniomyces occidentalis. [Arabidopsis thaliana]
- % Identity: 72.7
- Alignment Length: 44
- Location of Alignment in SEQ ID NO 868: from 115 to 158

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 869
- Ceres seq_id 1594752

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 870
- Ceres seq_id 1594753
- Location of start within SEQ ID NO 869: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

D3E3E3D.HTM

(Dp) Related Amino Acid Sequences
- Alignment No. 441
- gi No. 4056432
- Description: (AC005990) Similar to gi|2245014 glucosyltransferase homolog from Arabidopsis thaliana chromosome 4 contig gb|Z97341. ESTs gb|T20778 and gb|AA586281 come from this gene. [Arabidopsis thaliana]
- % Identity: 73.1
- Alignment Length: 52
- Location of Alignment in SEQ ID NO 870: from 305 to 356

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 871
- Ceres seq_id 1594755
- Location of start within SEQ ID NO 869: at 529 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 442
- gi No. 4056432
- Description: (AC005990) Similar to gi|2245014 glucosyltransferase homolog from Arabidopsis thaliana chromosome 4 contig gb|Z97341. ESTs gb|T20778 and gb|AA586281 come from this gene. [Arabidopsis thaliana]
- % Identity: 73.1
- Alignment Length: 52
- Location of Alignment in SEQ ID NO 871: from 129 to 180

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 872
- Ceres seq_id 1594760

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 873
- Ceres seq_id 1594761
- Location of start within SEQ ID NO 872: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 443
- gi No. 5724774
- Description: (AF160183) contains similarity to retrotransposons; may be a pseudogene [Arabidopsis thaliana]
- % Identity: 77.6
- Alignment Length: 49
- Location of Alignment in SEQ ID NO 873: from 42 to 90

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 874
- Ceres seq_id 1594763
- Location of start within SEQ ID NO 872: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 875

09035900.1501300

- Ceres seq_id 1594807

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 876
- Ceres seq_id 1594808
- Location of start within SEQ ID NO 875: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 877
- Ceres seq_id 1594810
- Location of start within SEQ ID NO 875: at 3 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 444
- gi No. 3047073
- Description: (AF058825) contains similarity to retrotransposon-like proteins [Arabidopsis thaliana]
- % Identity: 80
- Alignment Length: 15
- Location of Alignment in SEQ ID NO 877: from 1 to 15

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 878
- Ceres seq_id 1594833

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 879
- Ceres seq_id 1594834
- Location of start within SEQ ID NO 878: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Ribosomal protein L11
- Location within SEQ ID NO 879: from 43 to 188 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 445
- gi No. 1710483
- Description: 50S RIBOSOMAL PROTEIN L11 >gi|1213239|emb|CAA65166| (X95916) ribosomal protein L11 [Streptomyces galbus]
- % Identity: 70
- Alignment Length: 40
- Location of Alignment in SEQ ID NO 879: from 35 to 74

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 880
- Ceres seq_id 1594836
- Location of start within SEQ ID NO 878: at 208 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Ribosomal protein L11
- Location within SEQ ID NO 880: from 1 to 119 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 881
- Ceres seq_id 1594860

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 882
- Ceres seq_id 1594861
- Location of start within SEQ ID NO 881: at 138 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Ribosomal protein L6
- Location within SEQ ID NO 882: from 9 to 88 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- NB-ARC domain
- Location within SEQ ID NO 1026: from 21 to 304 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 515
- gi No. 5302806
- Description: (Z97342) disease resistance RPP5 like protein [Arabidopsis thaliana]
- % Identity: 71.4
- Alignment Length: 14
- Location of Alignment in SEQ ID NO 1026: from 446 to 459

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1027
- Ceres seq_id 1596069

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1028
- Ceres seq_id 1596070
- Location of start within SEQ ID NO 1027: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 516
- gi No. 2213582
- Description: (AC000348) T7N9.2 [Arabidopsis thaliana]
- % Identity: 79.3
- Alignment Length: 82
- Location of Alignment in SEQ ID NO 1028: from 55 to 136

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1029
- Ceres seq_id 1596071
- Location of start within SEQ ID NO 1027: at 52 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 517
- gi No. 2213582
- Description: (AC000348) T7N9.2 [Arabidopsis thaliana]
- % Identity: 79.3
- Alignment Length: 82
- Location of Alignment in SEQ ID NO 1029: from 38 to 119

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1030
- Ceres seq_id 1596072

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1031
- Ceres seq_id 1596073
- Location of start within SEQ ID NO 1030: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 518
- gi No. 3169719
- Description: (AF007109) similar to yeast dcp1 [Arabidopsis thaliana]
- % Identity: 98.6
- Alignment Length: 355
- Location of Alignment in SEQ ID NO 1031: from 1 to 355

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1032
- Ceres seq_id 1596075
- Location of start within SEQ ID NO 1030: at 232 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 519
- gi No. 3169719
- Description: (AF007109) similar to yeast dcp1 [Arabidopsis thaliana]
- % Identity: 98.6
- Alignment Length: 355
- Location of Alignment in SEQ ID NO 1032: from 1 to 278

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1033
- Ceres seq_id 1596076

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1034
- Ceres seq_id 1596077

- Location of start within SEQ ID NO 1033: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- L1P family of ribosomal proteins
- Location within SEQ ID NO 1034: from 7 to 207 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 520
- gi No. 1709970
- Description: 60S RIBOSOMAL PROTEIN L10A
- % Identity: 94.4
- Alignment Length: 126
- Location of Alignment in SEQ ID NO 1034: from 1 to 126

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1035
- Ceres seq_id 1596079
- Location of start within SEQ ID NO 1033: at 184 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- L1P family of ribosomal proteins
- Location within SEQ ID NO 1035: from 1 to 146 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 521
- gi No. 1709970
- Description: 60S RIBOSOMAL PROTEIN L10A
- % Identity: 94.4
- Alignment Length: 126
- Location of Alignment in SEQ ID NO 1035: from 1 to 65

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1036
- Ceres seq_id 1596087

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1037
- Ceres seq_id 1596088
- Location of start within SEQ ID NO 1036: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Eukaryotic DNA topoisomerase I
- Location within SEQ ID NO 1037: from 322 to 561 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 522
- gi No. 3695391
- Description: (AF096371) No definition line found [Arabidopsis thaliana]
- % Identity: 91.4
- Alignment Length: 232
- Location of Alignment in SEQ ID NO 1037: from 1 to 217

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1038
- Ceres seq_id 1596090
- Location of start within SEQ ID NO 1036: at 52 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Eukaryotic DNA topoisomerase I
- Location within SEQ ID NO 1038: from 305 to 544 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 523
- gi No. 3695391
- Description: (AF096371) No definition line found [Arabidopsis thaliana]
- % Identity: 91.4
- Alignment Length: 232
- Location of Alignment in SEQ ID NO 1038: from 1 to 200

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1039
- Ceres seq_id 1596095

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1040
- Ceres seq_id 1596096
- Location of start within SEQ ID NO 1039: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Eukaryotic DNA topoisomerase I
- Location within SEQ ID NO 1040: from 295 to 534 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 524
- gi No. 3695391
- Description: (AF096371) No definition line found [Arabidopsis thaliana]
- % Identity: 96.5
- Alignment Length: 198
- Location of Alignment in SEQ ID NO 1040: from 553 to 750

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1041
- Ceres seq_id 1596098
- Location of start within SEQ ID NO 1039: at 52 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Eukaryotic DNA topoisomerase I
- Location within SEQ ID NO 1041: from 278 to 517 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 525
- gi No. 3695391
- Description: (AF096371) No definition line found [Arabidopsis thaliana]
- % Identity: 96.5
- Alignment Length: 198
- Location of Alignment in SEQ ID NO 1041: from 536 to 733

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence

- Pat. Appln. SEQ ID NO 1042
- Ceres seq_id 1596099

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1043
- Ceres seq_id 1596100
- Location of start within SEQ ID NO 1042: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- DEAD/DEAH box helicase
- Location within SEQ ID NO 1043: from 103 to 312 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1044
- Ceres seq_id 1596102
- Location of start within SEQ ID NO 1042: at 205 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- DEAD/DEAH box helicase
- Location within SEQ ID NO 1044: from 35 to 244 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1045
- Ceres seq_id 1596137

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1046
- Ceres seq_id 1596138
- Location of start within SEQ ID NO 1045: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Retroviral aspartyl proteases
- Location within SEQ ID NO 1046: from 307 to 390 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 526
- gi No. 3047066
- Description: (AF058825) contains similarity to retrovirus-related POL polyproteins [Arabidopsis thaliana]
- % Identity: 82.1
- Alignment Length: 301
- Location of Alignment in SEQ ID NO 1046: from 1 to 285

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1047
- Ceres seq_id 1596140
- Location of start within SEQ ID NO 1045: at 97 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Retroviral aspartyl proteases
- Location within SEQ ID NO 1047: from 275 to 358 aa.

(Dp) Related Amino Acid Sequences

DOCKET NO. 80146.003

- Alignment No. 527
- gi No. 3047066
- Description: (AF058825) contains similarity to retrovirus-related POL polyproteins [Arabidopsis thaliana]
- % Identity: 82.1
- Alignment Length: 301
- Location of Alignment in SEQ ID NO 1047: from 1 to 253

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1048
- Ceres seq_id 1596141

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1049
- Ceres seq_id 1596142
- Location of start within SEQ ID NO 1048: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Reverse transcriptase (RNA-dependent DNA polymerase)
- Location within SEQ ID NO 1049: from 56 to 165 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 528
- gi No. 1419123
- Description: (Z75497) reverse transcriptase [Oryza sativa]
- % Identity: 70.8
- Alignment Length: 24
- Location of Alignment in SEQ ID NO 1049: from 134 to 157

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1050
- Ceres seq_id 1596144
- Location of start within SEQ ID NO 1048: at 523 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1051
- Ceres seq_id 1596153

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1052
- Ceres seq_id 1596154
- Location of start within SEQ ID NO 1051: at 3 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Eukaryotic DNA topoisomerase I
- Location within SEQ ID NO 1052: from 246 to 482 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1053
- Ceres seq_id 1596155
- Location of start within SEQ ID NO 1051: at 285 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Eukaryotic DNA topoisomerase I
- Location within SEQ ID NO 1053: from 152 to 388 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1054
- Ceres seq_id 1596156
- Location of start within SEQ ID NO 1051: at 378 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Eukaryotic DNA topoisomerase I
- Location within SEQ ID NO 1054: from 121 to 357 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1055
- Ceres seq_id 1596158

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1056
- Ceres seq_id 1596159
- Location of start within SEQ ID NO 1055: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Papain family cysteine protease
- Location within SEQ ID NO 1056: from 138 to 353 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 529
- gi No. 4836904
- Description: (AC007369) lcl|prt_seq No definition line found [Arabidopsis thaliana]
- % Identity: 100
- Alignment Length: 356
- Location of Alignment in SEQ ID NO 1056: from 1 to 356

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1057
- Ceres seq_id 1596161
- Location of start within SEQ ID NO 1055: at 328 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Papain family cysteine protease
- Location within SEQ ID NO 1057: from 29 to 244 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 530
- gi No. 4836904
- Description: (AC007369) lcl|prt_seq No definition line found [Arabidopsis thaliana]
- % Identity: 100
- Alignment Length: 356

- Location of Alignment in SEQ ID NO 1057: from 1 to 247

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1058
- Ceres seq_id 1596204

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1059
- Ceres seq_id 1596205
- Location of start within SEQ ID NO 1058: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Cytochrome P450
- Location within SEQ ID NO 1059: from 1 to 79 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 531
- gi No. 5280993
- Description: (Z97338) cytochrome P450 like protein [Arabidopsis thaliana]
- % Identity: 100
- Alignment Length: 79
- Location of Alignment in SEQ ID NO 1059: from 1 to 79

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1060
- Ceres seq_id 1596206
- Location of start within SEQ ID NO 1058: at 52 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Cytochrome P450
- Location within SEQ ID NO 1060: from 1 to 62 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 532
- gi No. 5280993
- Description: (Z97338) cytochrome P450 like protein [Arabidopsis thaliana]
- % Identity: 100
- Alignment Length: 79
- Location of Alignment in SEQ ID NO 1060: from 1 to 62

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1061
- Ceres seq_id 1596252

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1062
- Ceres seq_id 1596253
- Location of start within SEQ ID NO 1061: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 533
- gi No. 3377846

- Description: (AF076274) No definition line found [Arabidopsis thaliana]
- % Identity: 80
- Alignment Length: 120
- Location of Alignment in SEQ ID NO 1062: from 37 to 146

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1063
- Ceres seq_id 1596254
- Location of start within SEQ ID NO 1061: at 17 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 534
- gi No. 3377846
- Description: (AF076274) No definition line found [Arabidopsis thaliana]
- % Identity: 80
- Alignment Length: 120
- Location of Alignment in SEQ ID NO 1063: from 32 to 141

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1064
- Ceres seq_id 1596255
- Location of start within SEQ ID NO 1061: at 164 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 535
- gi No. 3377846
- Description: (AF076274) No definition line found [Arabidopsis thaliana]
- % Identity: 80
- Alignment Length: 120
- Location of Alignment in SEQ ID NO 1064: from 1 to 92

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1065
- Ceres seq_id 1596264

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1066
- Ceres seq_id 1596265
- Location of start within SEQ ID NO 1065: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 536
- gi No. 3377846
- Description: (AF076274) No definition line found [Arabidopsis thaliana]
- % Identity: 74.2
- Alignment Length: 31
- Location of Alignment in SEQ ID NO 1066: from 12 to 42

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1067

- Ceres seq_id 1596266
- Location of start within SEQ ID NO 1065: at 91 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 537
- gi No. 3377846
- Description: (AF076274) No definition line found [Arabidopsis thaliana]
- % Identity: 74.2
- Alignment Length: 31
- Location of Alignment in SEQ ID NO 1067: from 1 to 12

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1068
- Ceres seq_id 1596267
- Location of start within SEQ ID NO 1065: at 112 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1069
- Ceres seq_id 1596280

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1070
- Ceres seq_id 1596281
- Location of start within SEQ ID NO 1069: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Reverse transcriptase (RNA-dependent DNA polymerase)
- Location within SEQ ID NO 1070: from 2 to 56 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 538
- gi No. 5724766
- Description: (AF160181) contains similarity to retroviral intergrases; may be a pseudogene [Arabidopsis thaliana]
- % Identity: 72.5
- Alignment Length: 200
- Location of Alignment in SEQ ID NO 1070: from 274 to 471

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1071
- Ceres seq_id 1596283
- Location of start within SEQ ID NO 1069: at 16 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Reverse transcriptase (RNA-dependent DNA polymerase)
- Location within SEQ ID NO 1071: from 1 to 51 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 539
- gi No. 5724766

09509560 - 050300

- Description: (AF160181) contains similarity to retroviral intergrases; may be a pseudogene [Arabidopsis thaliana]
- % Identity: 72.5
- Alignment Length: 200
- Location of Alignment in SEQ ID NO 1071: from 269 to 466

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1072
- Ceres seq_id 1596332

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1073
- Ceres seq_id 1596333
- Location of start within SEQ ID NO 1072: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Fibronectin type III domain
- Location within SEQ ID NO 1073: from 20 to 106 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1074
- Ceres seq_id 1596335
- Location of start within SEQ ID NO 1072: at 95 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1075
- Ceres seq_id 1596336

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1076
- Ceres seq_id 1596337
- Location of start within SEQ ID NO 1075: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 540
- gi No. 1084367
- Description: C9 protein - kidney bean
- % Identity: 78.1
- Alignment Length: 32
- Location of Alignment in SEQ ID NO 1076: from 106 to 137

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1077
- Ceres seq_id 1596338
- Location of start within SEQ ID NO 1075: at 40 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 541

09609900.1501400

- gi No. 1084367
- Description: C9 protein - kidney bean
- % Identity: 78.1
- Alignment Length: 32
- Location of Alignment in SEQ ID NO 1077: from 93 to 124

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1078
- Ceres seq_id 1596339
- Location of start within SEQ ID NO 1075: at 49 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 542
- gi No. 1084367
- Description: C9 protein - kidney bean
- % Identity: 78.1
- Alignment Length: 32
- Location of Alignment in SEQ ID NO 1078: from 90 to 121

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1079
- Ceres seq_id 1596343

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1080
- Ceres seq_id 1596344
- Location of start within SEQ ID NO 1079: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Uncharacterized protein family UPF0025
- Location within SEQ ID NO 1080: from 2 to 75 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1081
- Ceres seq_id 1596346
- Location of start within SEQ ID NO 1079: at 37 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Uncharacterized protein family UPF0025
- Location within SEQ ID NO 1081: from 1 to 63 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1082
- Ceres seq_id 1596350

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1083
- Ceres seq_id 1596351
- Location of start within SEQ ID NO 1082: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 543
- gi No. 3123327
- Description: (AJ005927) squalene epoxidase homologue [Arabidopsis thaliana]
- % Identity: 79.6
- Alignment Length: 113
- Location of Alignment in SEQ ID NO 1083: from 1 to 113

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1084
- Ceres seq_id 1596368

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1085
- Ceres seq_id 1596369
- Location of start within SEQ ID NO 1084: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 544
- gi No. 5732030
- Description: (AF147260) contains similarity to Drosophila suppressor of sable protein (GB:M57889) [Arabidopsis thaliana]
- % Identity: 72.3
- Alignment Length: 47
- Location of Alignment in SEQ ID NO 1085: from 1 to 47

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1086
- Ceres seq_id 1596371
- Location of start within SEQ ID NO 1084: at 169 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1087
- Ceres seq_id 1596407

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1088
- Ceres seq_id 1596408
- Location of start within SEQ ID NO 1087: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Protein phosphatase 2C
- Location within SEQ ID NO 1088: from 13 to 183 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1089
- Ceres seq_id 1596410

- Location of start within SEQ ID NO 1087: at 31 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Protein phosphatase 2C
- Location within SEQ ID NO 1089: from 3 to 173 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1090
- Ceres seq_id 1596461

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1091
- Ceres seq_id 1596462
- Location of start within SEQ ID NO 1090: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 545
- gi No. 5080810
- Description: (AC007258) Very similar to helicases [Arabidopsis thaliana]
- % Identity: 89.3
- Alignment Length: 28
- Location of Alignment in SEQ ID NO 1091: from 379 to 405

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1092
- Ceres seq_id 1596463
- Location of start within SEQ ID NO 1090: at 58 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 546
- gi No. 5080810
- Description: (AC007258) Very similar to helicases [Arabidopsis thaliana]
- % Identity: 89.3
- Alignment Length: 28
- Location of Alignment in SEQ ID NO 1092: from 360 to 386

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1093
- Ceres seq_id 1596464
- Location of start within SEQ ID NO 1090: at 124 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 547
- gi No. 5080810
- Description: (AC007258) Very similar to helicases [Arabidopsis thaliana]
- % Identity: 89.3
- Alignment Length: 28
- Location of Alignment in SEQ ID NO 1093: from 338 to 364

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1094
- Ceres seq_id 1596522

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1095
- Ceres seq_id 1596523
- Location of start within SEQ ID NO 1094: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 548
- gi No. 3377838
- Description: (AF075598) No definition line found [Arabidopsis thaliana]
- % Identity: 73.1
- Alignment Length: 52
- Location of Alignment in SEQ ID NO 1095: from 251 to 301

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1096
- Ceres seq_id 1596532

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1097
- Ceres seq_id 1596533
- Location of start within SEQ ID NO 1096: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- ADP-ribosylation factor family
- Location within SEQ ID NO 1097: from 19 to 139 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1098
- Ceres seq_id 1596534
- Location of start within SEQ ID NO 1096: at 187 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- ADP-ribosylation factor family
- Location within SEQ ID NO 1098: from 1 to 77 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1099
- Ceres seq_id 1596611

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1100
- Ceres seq_id 1596612
- Location of start within SEQ ID NO 1099: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Reverse transcriptase (RNA-dependent DNA polymerase)
- Location within SEQ ID NO 1100: from 91 to 194 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1101
- Ceres seq_id 1596614
- Location of start within SEQ ID NO 1099: at 67 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Reverse transcriptase (RNA-dependent DNA polymerase)
- Location within SEQ ID NO 1101: from 69 to 172 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1102
- Ceres seq_id 1596776

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1103
- Ceres seq_id 1596777
- Location of start within SEQ ID NO 1102: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Ligand-gated ion channel
- Location within SEQ ID NO 1103: from 269 to 329 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1104
- Ceres seq_id 1596779
- Location of start within SEQ ID NO 1102: at 55 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Ligand-gated ion channel
- Location within SEQ ID NO 1104: from 251 to 311 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1105
- Ceres seq_id 1596784

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1106
- Ceres seq_id 1596785
- Location of start within SEQ ID NO 1105: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Kelch motif

- Location within SEQ ID NO 1106: from 102 to 148 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1107
- Ceres seq_id 1596786
- Location of start within SEQ ID NO 1105: at 37 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Kelch motif
- Location within SEQ ID NO 1107: from 90 to 136 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1108
- Ceres seq_id 1596787
- Location of start within SEQ ID NO 1105: at 241 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Kelch motif
- Location within SEQ ID NO 1108: from 22 to 68 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1109
- Ceres seq_id 1596800

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1110
- Ceres seq_id 1596801
- Location of start within SEQ ID NO 1109: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- PH domain
- Location within SEQ ID NO 1110: from 226 to 278 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1111
- Ceres seq_id 1596802
- Location of start within SEQ ID NO 1109: at 80 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- PH domain
- Location within SEQ ID NO 1111: from 200 to 252 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1112
- Ceres seq_id 1596803
- Location of start within SEQ ID NO 1109: at 173 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- PH domain
- Location within SEQ ID NO 1112: from 169 to 221 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1113
- Ceres seq_id 1596804

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1114
- Ceres seq_id 1596805
- Location of start within SEQ ID NO 1113: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- PH domain
- Location within SEQ ID NO 1114: from 240 to 292 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1115
- Ceres seq_id 1596806
- Location of start within SEQ ID NO 1113: at 79 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- PH domain
- Location within SEQ ID NO 1115: from 214 to 266 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1116
- Ceres seq_id 1596807
- Location of start within SEQ ID NO 1113: at 172 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- PH domain
- Location within SEQ ID NO 1116: from 183 to 235 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1117
- Ceres seq_id 1596885

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1118
- Ceres seq_id 1596886
- Location of start within SEQ ID NO 1117: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

- Uncharacterized protein family UPF0016
- Location within SEQ ID NO 1118: from 1 to 91 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 549
- gi No. 5734713
- Description: (AC008075) Is a member of PF|01169 Uncharacterized (transmembrane domain) protein family. [Arabidopsis thaliana]
- % Identity: 84.8
- Alignment Length: 152
- Location of Alignment in SEQ ID NO 1118: from 1 to 136

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1119
- Ceres seq_id 1596887
- Location of start within SEQ ID NO 1117: at 8 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Uncharacterized protein family UPF0016
- Location within SEQ ID NO 1119: from 1 to 89 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 550
- gi No. 5734713
- Description: (AC008075) Is a member of PF|01169 Uncharacterized (transmembrane domain) protein family. [Arabidopsis thaliana]
- % Identity: 84.8
- Alignment Length: 152
- Location of Alignment in SEQ ID NO 1119: from 1 to 134

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1120
- Ceres seq_id 1596888
- Location of start within SEQ ID NO 1117: at 62 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Uncharacterized protein family UPF0016
- Location within SEQ ID NO 1120: from 1 to 71 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 551
- gi No. 5734713
- Description: (AC008075) Is a member of PF|01169 Uncharacterized (transmembrane domain) protein family. [Arabidopsis thaliana]
- % Identity: 84.8
- Alignment Length: 152
- Location of Alignment in SEQ ID NO 1120: from 1 to 116

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1121
- Ceres seq_id 1596933

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1122
- Ceres seq_id 1596934
- Location of start within SEQ ID NO 1121: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Eukaryotic protein kinase domain
- Location within SEQ ID NO 1122: from 444 to 642 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1123
- Ceres seq_id 1596936
- Location of start within SEQ ID NO 1121: at 361 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Eukaryotic protein kinase domain
- Location within SEQ ID NO 1123: from 324 to 522 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1124
- Ceres seq_id 1596960

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1125
- Ceres seq_id 1596961
- Location of start within SEQ ID NO 1124: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 552
- gi No. 2289011
- Description: (AC002335) MYB transcription factor isolog [Arabidopsis thaliana]
- % Identity: 95.8
- Alignment Length: 381
- Location of Alignment in SEQ ID NO 1125: from 1 to 381

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1126
- Ceres seq_id 1596963
- Location of start within SEQ ID NO 1124: at 301 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 553
- gi No. 2289011
- Description: (AC002335) MYB transcription factor isolog [Arabidopsis thaliana]
- % Identity: 95.8
- Alignment Length: 381
- Location of Alignment in SEQ ID NO 1126: from 1 to 281

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1127
- Ceres seq_id 1596968

09609360.1.DOC

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1128
- Ceres seq_id 1596969
- Location of start within SEQ ID NO 1127: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- retroviral pol related endonuclease
- Location within SEQ ID NO 1128: from 5 to 82 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 554
- gi No. 5724766
- Description: (AF160181) contains similarity to retroviral intergrases; may be a pseudogene [Arabidopsis thaliana]
- % Identity: 78.5
- Alignment Length: 107
- Location of Alignment in SEQ ID NO 1128: from 1 to 105

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1129
- Ceres seq_id 1596971
- Location of start within SEQ ID NO 1127: at 79 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- retroviral pol related endonuclease
- Location within SEQ ID NO 1129: from 1 to 56 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 555
- gi No. 5724766
- Description: (AF160181) contains similarity to retroviral intergrases; may be a pseudogene [Arabidopsis thaliana]
- % Identity: 78.5
- Alignment Length: 107
- Location of Alignment in SEQ ID NO 1129: from 1 to 79

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1130
- Ceres seq_id 1596976

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1131
- Ceres seq_id 1596977
- Location of start within SEQ ID NO 1130: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 556

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1152
- Ceres seq_id 1597018

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1153
- Ceres seq_id 1597019

09604.PDF

- Location of start within SEQ ID NO 1152: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Reverse transcriptase (RNA-dependent DNA polymerase)
- Location within SEQ ID NO 1153: from 117 to 397 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1154
- Ceres seq_id 1597020
- Location of start within SEQ ID NO 1152: at 140 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Reverse transcriptase (RNA-dependent DNA polymerase)
- Location within SEQ ID NO 1154: from 71 to 351 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1155
- Ceres seq_id 1597021
- Location of start within SEQ ID NO 1152: at 206 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Reverse transcriptase (RNA-dependent DNA polymerase)
- Location within SEQ ID NO 1155: from 49 to 329 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1156
- Ceres seq_id 1597022

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1157
- Ceres seq_id 1597023
- Location of start within SEQ ID NO 1156: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Cyclic nucleotide-binding domain
- Location within SEQ ID NO 1157: from 4 to 86 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1158
- Ceres seq_id 1597024
- Location of start within SEQ ID NO 1156: at 19 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Cyclic nucleotide-binding domain
- Location within SEQ ID NO 1158: from 1 to 80 aa.

(Dp) Related Amino Acid Sequences

DOCKET ALARM

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1159
- Ceres seq_id 1597025
- Location of start within SEQ ID NO 1156: at 118 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1160
- Ceres seq_id 1597076

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1161
- Ceres seq_id 1597077
- Location of start within SEQ ID NO 1160: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Glutathione S-transferases.
- Location within SEQ ID NO 1161: from 5 to 196 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 566
- gi No. 4006934
- Description: (AJ012571) glutathione transferase [Arabidopsis thaliana]
- % Identity: 74
- Alignment Length: 219
- Location of Alignment in SEQ ID NO 1161: from 1 to 219

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1162
- Ceres seq_id 1597079
- Location of start within SEQ ID NO 1160: at 40 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Glutathione S-transferases.
- Location within SEQ ID NO 1162: from 1 to 183 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 567
- gi No. 4006934
- Description: (AJ012571) glutathione transferase [Arabidopsis thaliana]
- % Identity: 74
- Alignment Length: 219
- Location of Alignment in SEQ ID NO 1162: from 1 to 206

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1163
- Ceres seq_id 1597092

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1164
- Ceres seq_id 1597093

- Location of start within SEQ ID NO 1163: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Helicases conserved C-terminal domain
- Location within SEQ ID NO 1164: from 2 to 75 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1165
- Ceres seq_id 1597094
- Location of start within SEQ ID NO 1163: at 65 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Helicases conserved C-terminal domain
- Location within SEQ ID NO 1165: from 1 to 54 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1166
- Ceres seq_id 1597095
- Location of start within SEQ ID NO 1163: at 227 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1167

DOCUMENT-ID-US-6410704

- Description: (Z95745) R2R3-MYB transcription factor [Arabidopsis thaliana]
- % Identity: 73.1
- Alignment Length: 26
- Location of Alignment in SEQ ID NO 1796: from 88 to 113

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1797
- Ceres seq_id 1599137
- Location of start within SEQ ID NO 1794: at 45 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Myb-like DNA-binding domain
- Location within SEQ ID NO 1797: from 69 to 112 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 878
- gi No. 2832387
- Description: (Z95745) R2R3-MYB transcription factor [Arabidopsis thaliana]
- % Identity: 73.1
- Alignment Length: 26
- Location of Alignment in SEQ ID NO 1797: from 74 to 99

Maximum Length Sequence:
related to:
Clone IDs:
313138

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1798
- Ceres seq_id 1599138

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1799
- Ceres seq_id 1599139
- Location of start within SEQ ID NO 1798: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Mucin-like glycoprotein
- Location within SEQ ID NO 1799: from 11 to 142 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1800
- Ceres seq_id 1599140
- Location of start within SEQ ID NO 1798: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1801
- Ceres seq_id 1599141
- Location of start within SEQ ID NO 1798: at 3 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Ras family

09609.1350

- Location within SEQ ID NO 1801: from 70 to 161 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 879

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 903
- gi No. 2431767
- Description: (U62751) acidic ribosomal protein P3a [Zea mays]
- % Identity: 94
- Alignment Length: 50
- Location of Alignment in SEQ ID NO 1849: from 28 to 77

Maximum Length Sequence:
related to:
Clone IDs:
319418

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1850
- Ceres seq_id 1599315

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1851
- Ceres seq_id 1599316
- Location of start within SEQ ID NO 1850: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Ubiquitin-conjugating enzyme
- Location within SEQ ID NO 1851: from 92 to 151 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 904
- gi No. 2982253
- Description: (AF051209) CROC-1-like protein [Picea mariana]
- % Identity: 84.7
- Alignment Length: 98
- Location of Alignment in SEQ ID NO 1851: from 61 to 157

Maximum Length Sequence:
related to:
Clone IDs:
319432

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1852
- Ceres seq_id 1599317

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1853
- Ceres seq_id 1599318
- Location of start within SEQ ID NO 1852: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1854
- Ceres seq_id 1599319
- Location of start within SEQ ID NO 1852: at 114 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 905
- gi No. 128388
- Description: NONSPECIFIC LIPID-TRANSFER PROTEIN PRECURSOR (LTP) (PHOSPHOLIPID TRANSFER PROTEIN) (PLTP) >gi|82711|pir||A31779 phospholipid transfer protein 9C2 precursor - maize >gi|168576 (J04176) phospholipid transfer protein precursor [Zea mays]
- % Identity: 100
- Alignment Length: 12
- Location of Alignment in SEQ ID NO 1854: from 1 to 12

Maximum Length Sequence:
related to:
Clone IDs:
319452
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1855
- Ceres seq_id 1599320

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1856
- Ceres seq_id 1599321
- Location of start within SEQ ID NO 1855: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Ribosomal protein S8
- Location within SEQ ID NO 1856: from 43 to 133 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1857
- Ceres seq_id 1599322
- Location of start within SEQ ID NO 1855: at 112 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Ribosomal protein S8
- Location within SEQ ID NO 1857: from 6 to 96 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1858
- Ceres seq_id 1599323
- Location of start within SEQ ID NO 1855: at 148 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Ribosomal protein S8
- Location within SEQ ID NO 1858: from 1 to 84 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:
related to:
Clone IDs:
319520
(Ac) cDNA Polynucleotide Sequence

09609609-110400

- Pat. Appln. SEQ ID NO 1859
- Ceres seq_id 1599324

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1860
- Ceres seq_id 1599325
- Location of start within SEQ ID NO 1859: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1861
- Ceres seq_id 1599326
- Location of start within SEQ ID NO 1859: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Eukaryotic protein kinase domain
- Location within SEQ ID NO 1861: from 62 to 114 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 906
- gi No. 3046731
- Description: (AJ005373) protein kinase [Craterostigma plantagineum]
- % Identity: 92.9
- Alignment Length: 56
- Location of Alignment in SEQ ID NO 1861: from 59 to 114

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1862
- Ceres seq_id 1599327
- Location of start within SEQ ID NO 1859: at 3 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- 7 transmembrane receptor (rhodopsin family)
- Location within SEQ ID NO 1862: from 10 to 89 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:
related to:
Clone IDs:
320152

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1863
- Ceres seq_id 1599360

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1864
- Ceres seq_id 1599361
- Location of start within SEQ ID NO 1863: at 3 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Ubiquitin-conjugating enzyme
- Location within SEQ ID NO 1864: from 45 to 157 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 907

- gi No. 1174162
- Description: (U44976) ubiquitin-conjugating enzyme [Arabidopsis thaliana] >gi|3746915 (AF091106) E2 ubiquitin-conjugating-like enzyme [Arabidopsis thaliana]
- % Identity: 92
- Alignment Length: 113
- Location of Alignment in SEQ ID NO 1864: from 45 to 157

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1865
- Ceres seq_id 1599362
- Location of start within SEQ ID NO 1863: at 225 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Ubiquitin-conjugating enzyme
- Location within SEQ ID NO 1865: from 1 to 83 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 908
- gi No. 1174162
- Description: (U44976) ubiquitin-conjugating enzyme [Arabidopsis thaliana] >gi|3746915 (AF091106) E2 ubiquitin-conjugating-like enzyme [Arabidopsis thaliana]
- % Identity: 92
- Alignment Length: 113
- Location of Alignment in SEQ ID NO 1865: from 1 to 83

Maximum Length Sequence:
related to:
Clone IDs:
320219
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1866
- Ceres seq_id 1599363

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1867
- Ceres seq_id 1599364
- Location of start within SEQ ID NO 1866: at 76 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Sugar (and other) transporter
- Location within SEQ ID NO 1867: from 48 to 103 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1868
- Ceres seq_id 1599365
- Location of start within SEQ ID NO 1866: at 91 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Sugar (and other) transporter
- Location within SEQ ID NO 1868: from 43 to 98 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:
related to:

Clone IDs:
320282
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1869
- Ceres seq_id 1599373

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1870
- Ceres seq_id 1599374
- Location of start within SEQ ID NO 1869: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Calreticulin family
- Location within SEQ ID NO 1870: from 50 to 150 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 909
- gi No. 510907
- Description: (Z35108) calnexin [Helianthus tuberosus]
- % Identity: 70.3
- Alignment Length: 118
- Location of Alignment in SEQ ID NO 1870: from 35 to 150

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1871
- Ceres seq_id 1599375
- Location of start within SEQ ID NO 1869: at 76 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Calreticulin family
- Location within SEQ ID NO 1871: from 25 to 125 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 910
- gi No. 510907
- Description: (Z35108) calnexin [Helianthus tuberosus]
- % Identity: 70.3
- Alignment Length: 118
- Location of Alignment in SEQ ID NO 1871: from 10 to 125

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1872
- Ceres seq_id 1599376
- Location of start within SEQ ID NO 1869: at 79 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Calreticulin family
- Location within SEQ ID NO 1872: from 24 to 124 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 911
- gi No. 510907
- Description: (Z35108) calnexin [Helianthus tuberosus]
- % Identity: 70.3
- Alignment Length: 118
- Location of Alignment in SEQ ID NO 1872: from 9 to 124

Maximum Length Sequence:
related to:

Clone IDs:
320388
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1873
- Ceres seq_id 1599385
(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1874
- Ceres seq_id 1599386
- Location of start within SEQ ID NO 1873: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 912
- gi No. 4090257
- Description: (AJ131732) ribosomal protein L37A [Pseudotsuga menziesii]
- % Identity: 98.5
- Alignment Length: 68
- Location of Alignment in SEQ ID NO 1874: from 29 to 96

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1875
- Ceres seq_id 1599387
- Location of start within SEQ ID NO 1873: at 85 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 913
- gi No. 4090257
- Description: (AJ131732) ribosomal protein L37A [Pseudotsuga menziesii]
- % Identity: 98.5
- Alignment Length: 68
- Location of Alignment in SEQ ID NO 1875: from 1 to 68

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1876
- Ceres seq_id 1599388
- Location of start within SEQ ID NO 1873: at 169 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 914
- gi No. 4090257
- Description: (AJ131732) ribosomal protein L37A [Pseudotsuga menziesii]
- % Identity: 98.5
- Alignment Length: 68
- Location of Alignment in SEQ ID NO 1876: from 1 to 40

Maximum Length Sequence:
related to:
Clone IDs:
320423
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1877
- Ceres seq_id 1599393
(B) Polypeptide Sequence

- Pat. Appln. SEQ ID NO 1878
- Ceres seq_id 1599394
- Location of start within SEQ ID NO 1877: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 915
- gi No. 2137785
- Description: SmD homolog, liver - mouse (fragment) >gi|557920|bbs|150447 (S71494) SmD homolog {Gly-Arg repeat} [mice, liver, Peptide Partial, 59 aa] [Mus sp.]
- % Identity: 78.9
- Alignment Length: 19
- Location of Alignment in SEQ ID NO 1878: from 108 to 126

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1879
- Ceres seq_id 1599395
- Location of start within SEQ ID NO 1877: at 80 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 916
- gi No. 2137785
- Description: SmD homolog, liver - mouse (fragment) >gi|557920|bbs|150447 (S71494) SmD homolog {Gly-Arg repeat} [mice, liver, Peptide Partial, 59 aa] [Mus sp.]
- % Identity: 78.9
- Alignment Length: 19
- Location of Alignment in SEQ ID NO 1879: from 82 to 100

Maximum Length Sequence:
related to:
Clone IDs:
320538
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1880
- Ceres seq_id 1599396

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1881
- Ceres seq_id 1599397
- Location of start within SEQ ID NO 1880: at 229 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 917
- gi No. 3914431
- Description: PROTEASOME COMPONENT C8 (MACROPAIN SUBUNIT C8) (MULTICATALYTIC ENDOPEPTIDASE COMPLEX SUBUNIT C8) >gi|2285802|dbj|BAA21651| (D78173) 26S proteasome alpha subunit [Spinacia oleracea]
- % Identity: 92
- Alignment Length: 75
- Location of Alignment in SEQ ID NO 1881: from 1 to 74

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1882
- Ceres seq_id 1599398
- Location of start within SEQ ID NO 1880: at 251 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

Maximum Length Sequence:
related to:
Clone IDs:
320628
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1883
- Ceres seq_id 1599403
(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1884
- Ceres seq_id 1599404
- Location of start within SEQ ID NO 1883: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1885
- Ceres seq_id 1599405
- Location of start within SEQ ID NO 1883: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1886
- Ceres seq_id 1599406
- Location of start within SEQ ID NO 1883: at 3 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Metallothionein
- Location within SEQ ID NO 1886: from 29 to 64 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 918
- gi No. 3694984
- Description: (AF093585) metallothionein-1-like protein [Pimpinella brachycarpa]
- % Identity: 78.3
- Alignment Length: 23
- Location of Alignment in SEQ ID NO 1886: from 26 to 48

Maximum Length Sequence:
related to:
Clone IDs:
320722
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1887
- Ceres seq_id 1599416
(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1888
- Ceres seq_id 1599417
- Location of start within SEQ ID NO 1887: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 919
- gi No. 2285792
- Description: (AB004568) cyanase [Arabidopsis thaliana] >gi|3287503|dbj|BAA31224| (AB015748) cyanase [Arabidopsis thaliana]
- % Identity: 75.2
- Alignment Length: 129
- Location of Alignment in SEQ ID NO 1888: from 41 to 168

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1889
- Ceres seq_id 1599418
- Location of start within SEQ ID NO 1887: at 121 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 920
- gi No. 2285792
- Description: (AB004568) cyanase [Arabidopsis thaliana] >gi|3287503|dbj|BAA31224| (AB015748) cyanase [Arabidopsis thaliana]
- % Identity: 75.2
- Alignment Length: 129
- Location of Alignment in SEQ ID NO 1889: from 1 to 128

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1890
- Ceres seq_id 1599419
- Location of start within SEQ ID NO 1887: at 163 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 921
- gi No. 2285792
- Description: (AB004568) cyanase [Arabidopsis thaliana] >gi|3287503|dbj|BAA31224| (AB015748) cyanase [Arabidopsis thaliana]
- % Identity: 75.2
- Alignment Length: 129
- Location of Alignment in SEQ ID NO 1890: from 1 to 114

Maximum Length Sequence:
related to:
Clone IDs:
320798
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1891
- Ceres seq_id 1599424

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1892
- Ceres seq_id 1599425
- Location of start within SEQ ID NO 1891: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- 7 transmembrane receptor (rhodopsin family)
- Location within SEQ ID NO 1892: from 30 to 126 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1893
- Ceres seq_id 1599426
- Location of start within SEQ ID NO 1891: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1894
- Ceres seq_id 1599427
- Location of start within SEQ ID NO 1891: at 93 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Flavin-binding monooxygenase-like
- Location within SEQ ID NO 1894: from 7 to 117 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:
related to:
Clone IDs:
320985
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 1895
- Ceres seq_id 1599434

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1896
- Ceres seq_id 1599435
- Location of start within SEQ ID NO 1895: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 922
- gi No. 3153821
- Description: (AF062655) plenty-of-prolines-101; POP101; SH3-philo-protein [Mus musculus]
- % Identity: 70.6
- Alignment Length: 17
- Location of Alignment in SEQ ID NO 1896: from 17 to 32

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1897
- Ceres seq_id 1599436
- Location of start within SEQ ID NO 1895: at 106 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 1898
- Ceres seq_id 1599437
- Location of start within SEQ ID NO 1895: at 191 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

- 7 transmembrane receptor (rhodopsin family)
- Location within SEQ ID NO 1898: from 15 to 102 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:
related to:
Clone IDs:
320997

- Location of start within SEQ ID NO 2254: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2256
- Ceres seq_id 1600539

09600.0004.PCUS00

- Location of start within SEQ ID NO 2254: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- short chain dehydrogenase
- Location within SEQ ID NO 2256: from 66 to 129 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2257
- Ceres seq_id 1600540
- Location of start within SEQ ID NO 2254: at 149 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- short chain dehydrogenase
- Location within SEQ ID NO 2257: from 17 to 80 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:
related to:
Clone IDs:
320898
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2258
- Ceres seq_id 1600552

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2259
- Ceres seq_id 1600553
- Location of start within SEQ ID NO 2258: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2260
- Ceres seq_id 1600554
- Location of start within SEQ ID NO 2258: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 1071
- gi No. 3132288
- Description: (AB011490) short ORF [TT virus]
- % Identity: 70.6
- Alignment Length: 17
- Location of Alignment in SEQ ID NO 2260: from 121 to 137

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2261
- Ceres seq_id 1600555
- Location of start within SEQ ID NO 2258: at 3 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- 7 transmembrane receptor (rhodopsin family)
- Location within SEQ ID NO 2261: from 6 to 138 aa.

09609300 - 102700

(Dp) Related Amino Acid Sequences
- Alignment No. 1072
- gi No. 624076
- Description: (U42580) contains Pro-rich Px motifs: SPKPP (20X), PEPPA (9X); similar to soybean pro-rich cell wall protein, corresponds to Swiss-Prot Accession Number P13993 [Paramecium bursaria Chlorella virus 1]
- % Identity: 71.4
- Alignment Length: 14
- Location of Alignment in SEQ ID NO 2261: from 82 to 95

Maximum Length Sequence:
related to:
Clone IDs:
321554
(Ac) cDNA Polynucleotide Sequence

- Description: (Y17562) surface protein [Hepatitis B virus]
- % Identity: 71.4
- Alignment Length: 14
- Location of Alignment in SEQ ID NO 2313: from 34 to 45

Maximum Length Sequence:
related to:
Clone IDs:
325632
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2314
- Ceres seq_id 1600744
(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2315
- Ceres seq_id 1600745
- Location of start within SEQ ID NO 2314: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2316
- Ceres seq_id 1600746
- Location of start within SEQ ID NO 2314: at 148 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2317
- Ceres seq_id 1600747
- Location of start within SEQ ID NO 2314: at 249 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 1088
- gi No. 1917019
- Description: (U92045) ribosomal protein S6 RPS6-1 [Zea mays]
- % Identity: 94.5
- Alignment Length: 91
- Location of Alignment in SEQ ID NO 2317: from 1 to 39

Maximum Length Sequence:
related to:
Clone IDs:
327242
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2318
- Ceres seq_id 1600768
(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2319
- Ceres seq_id 1600769
- Location of start within SEQ ID NO 2318: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Ras family
- Location within SEQ ID NO 2319: from 51 to 167 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 1089
- gi No. 3024501

- Alignment Length: 163
- Location of Alignment in SEQ ID NO 2592: from 1 to 137

Maximum Length Sequence:
related to:
Clone IDs:
335373
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2593
- Ceres seq_id 1601476

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2594
- Ceres seq_id 1601477
- Location of start within SEQ ID NO 2593: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2595
- Ceres seq_id 1601478
- Location of start within SEQ ID NO 2593: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2596
- Ceres seq_id 1601479
- Location of start within SEQ ID NO 2593: at 3 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- DnaJ domain
- Location within SEQ ID NO 2596: from 92 to 159 aa.

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:
related to:
Clone IDs:
335381
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2597
- Ceres seq_id 1601480

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2598
- Ceres seq_id 1601481
- Location of start within SEQ ID NO 2597: at 98 nt.

09609300.040304

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Phosphoribosyl pyrophosphate synthetase
- Location within SEQ ID NO 2598: from 83 to 130 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 1207
- gi No. 4902849
- Description: (AJ006940) phosphoribosyl pyrophosphate synthase [Spinacia oleracea]
- % Identity: 88.9
- Alignment Length: 54
- Location of Alignment in SEQ ID NO 2598: from 78 to 130

Maximum Length Sequence:
related to:
Clone IDs:
335569
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2599

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2649
- Ceres seq_id 1601573
- Location of start within SEQ ID NO 2647: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2650
- Ceres seq_id 1601574
- Location of start within SEQ ID NO 2647: at 82 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 1228
- gi No. 4902879
- Description: (AJ006943) phosphoribosyl pyrophosphate synthase isozyme 4 [Spinacia oleracea]
- % Identity: 81.7
- Alignment Length: 120
- Location of Alignment in SEQ ID NO 2650: from 13 to 132

Maximum Length Sequence:
related to:
Clone IDs:
336268

09509.1500

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2651
- Ceres seq_id 1601575

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2652
- Ceres seq_id 1601576
- Location of start within SEQ ID NO 2651: at 179 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- 6-phosphogluconate dehydrogenases
- Location within SEQ ID NO 2652: from 12 to 86 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 1229
- gi No. 3925225
- Description: (AF037030) 6-phosphogluconate dehydrogenase isoenzyme B [Zea mays]
- % Identity: 100
- Alignment Length: 86
- Location of Alignment in SEQ ID NO 2652: from 1 to 86

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2653
- Ceres seq_id 1601577
- Location of start within SEQ ID NO 2651: at 218 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- 6-phosphogluconate dehydrogenases
- Location within SEQ ID NO 2653: from 1 to 73 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 1230
- gi No. 3925225
- Description: (AF037030) 6-phosphogluconate dehydrogenase isoenzyme B [Zea mays]
- % Identity: 100
- Alignment Length: 86
- Location of Alignment in SEQ ID NO 2653: from 1 to 73

Maximum Length Sequence:
related to:
Clone IDs:
336313

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2654
- Ceres seq_id 1601582

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2655
- Ceres seq_id 1601583
- Location of start within SEQ ID NO 2654: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 1231
- gi No. 2384758
- Description: (AF016896) GDP dissociation inhibitor protein OsGDI1 [Oryza sativa]
- % Identity: 100

09609360.040900

- Alignment Length: 23
- Location of Alignment in SEQ ID NO 2655: from 38 to 60

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2656
- Ceres seq_id 1601584
- Location of start within SEQ ID NO 2654: at 3 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2657
- Ceres seq_id 1601585
- Location of start within SEQ ID NO 2654: at 270 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- GDP dissociation inhibitor
- Location within SEQ ID NO 2657: from 3 to 72 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 1232
- gi No. 2384758
- Description: (AF016896) GDP dissociation inhibitor protein OsGDI1 [Oryza sativa]
- % Identity: 94.4
- Alignment Length: 71
- Location of Alignment in SEQ ID NO 2657: from 3 to 72

Maximum Length Sequence:
related to:
Clone IDs:
336402

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2658
- Ceres seq_id 1601586

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2659
- Ceres seq_id 1601587
- Location of start within SEQ ID NO 2658: at 227 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 1233
- gi No. 2239260
- Description: (Y13734) cinnamoyl CoA reductase [Zea mays]
- % Identity: 100
- Alignment Length: 85
- Location of Alignment in SEQ ID NO 2659: from 1 to 85

Maximum Length Sequence:
related to:
Clone IDs:
336559

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2660
- Ceres seq_id 1601596

(B) Polypeptide Sequence

- Pat. Appln. SEQ ID NO 2661
- Ceres seq_id 1601597
- Location of start within SEQ ID NO 2660: at 89 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

- Alignment No. 1234
- gi No. 387050
- Description: (M15825) nucleolin, C23 [Cricetulus griseus]
- % Identity: 75
- Alignment Length: 12
- Location of Alignment in SEQ ID NO 2661: from 59 to 70

Maximum Length Sequence:
related to:
Clone IDs:
336566

(Ac) cDNA Polynucleotide Sequence

- Pat. Appln. SEQ ID NO 2662
- Ceres seq_id 1601598

(B) Polypeptide Sequence

- Pat. Appln. SEQ ID NO 2663
- Ceres seq_id 1601599
- Location of start within SEQ ID NO 2662: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

- Alignment No. 1235
- gi No. 1170396
- Description: SPERM PROTAMINE P1 >gi|598423 (L35450) protamine P1 [Macropus eugenii] >gi|1582116|prf||2117429J protamine P1 [Macropus eugenii]
- % Identity: 70.6
- Alignment Length: 17
- Location of Alignment in SEQ ID NO 2663: from 43 to 58

(B) Polypeptide Sequence

- Pat. Appln. SEQ ID NO 2664
- Ceres seq_id 1601600
- Location of start within SEQ ID NO 2662: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence

- Pat. Appln. SEQ ID NO 2665
- Ceres seq_id 1601601
- Location of start within SEQ ID NO 2662: at 47 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:
related to:

- Peroxidase
- Location within SEQ ID NO 2709: from 23 to 74 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 1252
- gi No. 1321661
- Description: (D45423) ascorbate peroxidase [Oryza sativa]
- % Identity: 87.3
- Alignment Length: 110
- Location of Alignment in SEQ ID NO 2709: from 1 to 74

Maximum Length Sequence:
related to:
Clone IDs:
332741

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2710
- Ceres seq_id 1601697

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2711
- Ceres seq_id 1601698
- Location of start within SEQ ID NO 2710: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2712
- Ceres seq_id 1601699
- Location of start within SEQ ID NO 2710: at 89 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Chlorophyll A-B binding proteins
- Location within SEQ ID NO 2712: from 51 to 138 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 1253
- gi No. 733456
- Description: (U23189) chlorophyll a/b-binding apoprotein CP26 precursor [Zeamays]
- % Identity: 100
- Alignment Length: 139
- Location of Alignment in SEQ ID NO 2712: from 1 to 138

Maximum Length Sequence:
related to:
Clone IDs:
332751
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2713
- Ceres seq_id 1601700
(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2714
- Ceres seq_id 1601701
- Location of start within SEQ ID NO 2713: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2715
- Ceres seq_id 1601702
- Location of start within SEQ ID NO 2713: at 199 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- S-adenosylmethionine synthetase
- Location within SEQ ID NO 2715: from 6 to 101 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 1254
- gi No. 1170937
- Description: S-ADENOSYLMETHIONINE SYNTHETASE 1 (METHIONINE ADENOSYLTRANSFERASE 1) (ADOMET SYNTHETASE 1) >gi|450549|emb|CAA81481| (Z26867) S-adenosyl methionine synthetase [Oryza sativa]
- % Identity: 98
- Alignment Length: 102
- Location of Alignment in SEQ ID NO 2715: from 1 to 101

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2716
- Ceres seq_id 1601703
- Location of start within SEQ ID NO 2713: at 281 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

Maximum Length Sequence:
related to:
Clone IDs:
332781
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2717
- Ceres seq_id 1601704
(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2718
- Ceres seq_id 1601705
- Location of start within SEQ ID NO 2717: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Band 7 family

09503600.1-1800

- Location within SEQ ID NO 2718: from 46 to 183 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 1255
- gi No. 1762949
- Description: (U66271) ORF; able to induce HR-like lesions [Nicotiana tabacum]
- % Identity: 89.5
- Alignment Length: 19
- Location of Alignment in SEQ ID NO 2718: from 53 to 71

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2719
- Ceres seq_id 1601706
- Location of start within SEQ ID NO 2717: at 157 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Band 7 family
- Location within SEQ ID NO 2719: from 1 to 131 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 1256
- gi No. 1762949
- Description: (U66271) ORF; able to induce HR-like lesions [Nicotiana tabacum]

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Cofilin/tropomyosin-type actin-binding proteins
- Location within SEQ ID NO 2822: from 14 to 99 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 1298
- gi No. 4185513
- Description: (AF102823) actin depolymerizing factor 5 [Arabidopsis thaliana] >gi|4185517 (AF102825) actin depolymerizing factor 5 [Arabidopsis thaliana]
- % Identity: 73.5
- Alignment Length: 102
- Location of Alignment in SEQ ID NO 2822: from 1 to 99

Maximum Length Sequence:
related to:
Clone IDs:
337827

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2823
- Ceres seq_id 1601976

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2824
- Ceres seq_id 1601977
- Location of start within SEQ ID NO 2823: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 1299
- gi No. 1346530
- Description: MAGO NASHI PROTEIN HOMOLOG
- % Identity: 98.5
- Alignment Length: 65
- Location of Alignment in SEQ ID NO 2824: from 56 to 120

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2825
- Ceres seq_id 1601978
- Location of start within SEQ ID NO 2823: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence

09504960.040504

- Pat. Appln. SEQ ID NO 2826
- Ceres seq_id 1601979
- Location of start within SEQ ID NO 2823: at 3 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

Maximum Length Sequence:
related to:
Clone IDs:
337838

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2827
- Ceres seq_id 1601980

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2828
- Ceres seq_id 1601981
- Location of start within SEQ ID NO 2827: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2829
- Ceres seq_id 1601982
- Location of start within SEQ ID NO 2827: at 141 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 1300
- gi No. 4914432
- Description: (AL050351) ribosomal protein S25 [Arabidopsis thaliana]
- % Identity: 76.4
- Alignment Length: 89
- Location of Alignment in SEQ ID NO 2829: from 1 to 89

Maximum Length Sequence:
related to:
Clone IDs:
337890

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2830
- Ceres seq_id 1601994

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2831
- Ceres seq_id 1601995
- Location of start within SEQ ID NO 2830: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- RNA recognition motif. (a.k.a. RRM, RBD, or RNP domain)
- Location within SEQ ID NO 2831: from 2 to 60 aa.

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2832

- Ceres seq_id 1601996
- Location of start within SEQ ID NO 2830: at 184 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

Maximum Length Sequence:
related to:
Clone IDs:
337928
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2833
- Ceres seq_id 1601997
(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2834
- Ceres seq_id 1601998
- Location of start within SEQ ID NO 2833: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 1301
- gi No. 3970680
- Description: (AL034388) 67A9.b [Drosophila melanogaster]
- % Identity: 80
- Alignment Length: 15
- Location of Alignment in SEQ ID NO 2834: from 111 to 125

Maximum Length Sequence:
related to:
Clone IDs:
337949
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2835
- Ceres seq_id 1602005
(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2836
- Ceres seq_id 1602006
- Location of start within SEQ ID NO 2835: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences
- Alignment No. 1302
- gi No. 102706
- Description: protamine - common cuttlefish
- % Identity: 71.4
- Alignment Length: 14
- Location of Alignment in SEQ ID NO 2836: from 114 to 127

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2837
- Ceres seq_id 1602007
- Location of start within SEQ ID NO 2835: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Aldehyde dehydrogenase
- Location within SEQ ID NO 2837: from 15 to 146 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 1303
- gi No. 1711534
- Description: SUCCINATE SEMIALDEHYDE DEHYDROGENASE (NAD(+)-DEPENDENT SUCCINIC SEMIALDEHYDE DEHYDROGENASE) >gi|2136207|pir||A55773 succinate-semialdehyde dehydrogenase (EC 1.2.1.24) - human (fragment) >gi|556221 (L34820) succinate
- % Identity: 73
- Alignment Length: 37
- Location of Alignment in SEQ ID NO 2837: from 110 to 146

Maximum Length Sequence:
related to:
Clone IDs:
338191
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2838
- Ceres seq_id 1602032

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2839
- Ceres seq_id 1602033
- Location of start within SEQ ID NO 2838: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2840
- Ceres seq_id 1602034
- Location of start within SEQ ID NO 2838: at 3 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2841
- Ceres seq_id 1602035
- Location of start within SEQ ID NO 2838: at 124 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- DnaJ domain
- Location within SEQ ID NO 2841: from 13 to 74 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 1304
- gi No. 2984709
- Description: (AF053468) DnaJ-related protein ZMDJ1 [Zea mays]
- % Identity: 99.1
- Alignment Length: 111
- Location of Alignment in SEQ ID NO 2841: from 1 to 111

Maximum Length Sequence:
related to:
Clone IDs:
338275
(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2842
- Ceres seq_id 1602039

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2843
- Ceres seq_id 1602040
- Location of start within SEQ ID NO 2842: at 1 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Ribosomal L27 protein
- Location within SEQ ID NO 2843: from 59 to 139 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 1305
- gi No. 2961176
- Description: (AF050674) ribosomal protein L27 precursor [Oryza sativa]
- % Identity: 83.8
- Alignment Length: 160
- Location of Alignment in SEQ ID NO 2843: from 4 to 157

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2844
- Ceres seq_id 1602041
- Location of start within SEQ ID NO 2842: at 10 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Ribosomal L27 protein
- Location within SEQ ID NO 2844: from 56 to 136 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 1306
- gi No. 2961176
- Description: (AF050674) ribosomal protein L27 precursor [Oryza sativa]
- % Identity: 83.8
- Alignment Length: 160
- Location of Alignment in SEQ ID NO 2844: from 1 to 154

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2845
- Ceres seq_id 1602042
- Location of start within SEQ ID NO 2842: at 19 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Ribosomal L27 protein
- Location within SEQ ID NO 2845: from 53 to 133 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 1307
- gi No. 2961176
- Description: (AF050674) ribosomal protein L27 precursor [Oryza sativa]
- % Identity: 83.8
- Alignment Length: 160
- Location of Alignment in SEQ ID NO 2845: from 1 to 151

Maximum Length Sequence:
related to:
Clone IDs:
338455

(Ac) cDNA Polynucleotide Sequence
- Pat. Appln. SEQ ID NO 2846
- Ceres seq_id 1602053

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2847
- Ceres seq_id 1602054
- Location of start within SEQ ID NO 2846: at 2 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2848
- Ceres seq_id 1602055
- Location of start within SEQ ID NO 2846: at 154 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)

(Dp) Related Amino Acid Sequences
- Alignment No. 1308
- gi No. 3063467
- Description: (AC003981) F22O13.29 [Arabidopsis thaliana]

- Description: (D67066) N-WASP [Bos taurus]
- % Identity: 71.4
- Alignment Length: 21

09505505 - 040100

- Location of Alignment in SEQ ID NO 2941: from 98 to 117

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2942
- Ceres seq_id 1602266
- Location of start within SEQ ID NO 2940: at 102 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Adhesion lipoprotein
- Location within SEQ ID NO 2942: from 20 to 84 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 1349
- gi No. 1644232
- Description: (D67066) N-WASP [Bos taurus]
- % Identity: 71.4
- Alignment Length: 21
- Location of Alignment in SEQ ID NO 2942: from 65 to 84

(B) Polypeptide Sequence
- Pat. Appln. SEQ ID NO 2943
- Ceres seq_id 1602267
- Location of start within SEQ ID NO 2940: at 117 nt.

(C) Nomination and Annotation of Domains within Predicted Polypeptide(s)
- Adhesion lipoprotein
- Location within SEQ ID NO 2943: from 15 to 79 aa.

(Dp) Related Amino Acid Sequences
- Alignment No. 1350
- gi No. 1644232
- Description: (D67066) N-WASP [Bos taurus]
- % Identity: 71.4
- Alignment Length: 21
- Location of Alignment in SEQ ID NO 2943: from 60 to 79

Maximum Length Sequence:
related to:
Clone IDs:
339027
(Ac) cDNA Polynucleotide Sequence
